to the Grid of the container. Make sure you don't take the emitter outside the container. Increase the timeline to `200 frames`. Select the container you just created, and then go to its attributes (make sure you are looking at the `fluidShape1` attributes).

For now, we are going to keep the resolution a little low. If your resolution and size is not `10`, then input `10` in all the six boxes. Change the Temperature and Fuel to `Dynamic Grid` from the dropdown menu.

Change your boundary from `Y` to `-Y`. Play the animation and see how it looks. Select the container, and under the `fluidEmitter1` attributes, change the following options:

Fluid Attributes: Heat/Voxel/Sec = `2.000`; Fuel/Voxel/Sec = `4.000`

Fluid Emission Turbulence: Turbulence = `1.150`.

Go to the `fluidShape1` attributes and change the following options:

Density: Buoyancy = `9.000`; Dissipation = `0.182`

Inside the `fluidShape1` attributes, change the following options under the `Contents Details` section:

Velocity: Swirl = `10.000`
Turbulence: Strength = `0.010`
Temperature: Temperature Scale = `1.930`; Buoyancy = `9.000`
