and teaching children. They also remind out that this list is far from complete. When looking at economic indicators in the United States, some experts, such as Eric Brynjolfsson and Andrew McAfee of the Massachusetts Institute of Technology (MIT), believe the concern is genuine. They demonstrate how, in the decades following WWII, the most important economic data in America climbed in lockstep. Along with productivity, the Gross Domestic Product (GDP) increased. Millions of employment were generated, many of which were suitable for persons without a college diploma. However, after that, the rise of productivity and employment began to diverge.

According to the decoupling data, the US economy has performed poorly for the lowest 90 per cent of Americans for the past four decades. During these decades, technology has substantially improved productivity, resulting in a booming economy. However, the majority of individuals do not benefit

Robots won't be replacing normal office jobs. These jobs will simply cease to exist

from the expansion. Although the American economy continues to create jobs, it is insufficient. In fact, since the late 1990s, statistics reveal that the active percentage of the labour force has been declining. Manufacturing output is currently at an all-time high, according to research. However, employment generation now is lower than it was in the late 1940s.

Since the late 1960s, non-supervisory employees' pay has remained unchanged. Since 1970, the wages-to-GDP ratio has been decreasing. The rate
