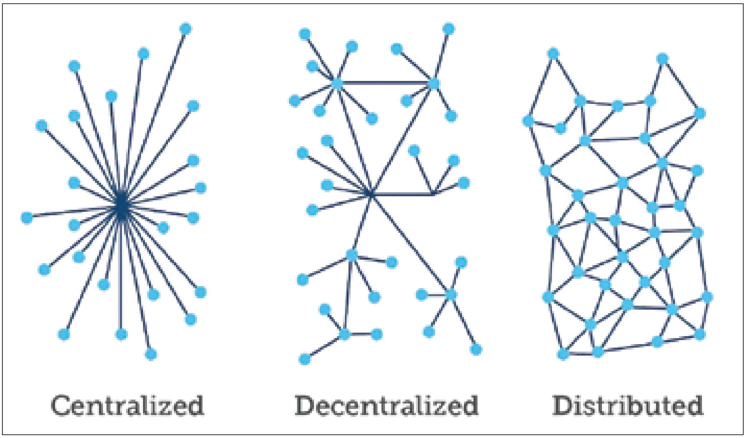
monumentally reduces the chances of tampering with data, as the culprit would have to make changes to all the ledger copies.

This form of ledger has been developed as a solution to trust issue of humans and removing the need of a middleman in all our transactions. Blockchain is the first mainstream system that would eventually form the Web3 internet. That would be a purely peer-to-peer internet, no middleman whatsoever. Whether you are booking cabs without Uber or Ola, hotel rooms without Oyo or shopping without Amazon, all transactions would be recorded and maintained by the members of the service itself.



Types of ledger systems

Important Terminologies

Smart Contracts - Similarly to traditional contracts, they provide the terms of a transaction. But unlike their traditional variants, smart ones operate without a middleman and are witnessed and verified by all the members of the ledger. They come along with a time constraint and keys for all the members of the transaction, including the products. If the transaction prolongs the date mentioned in the contract, a refund takes place and all the members of the ledger are updated. The transaction gets fulfilled when the product key is received by the member key mentioned in the contract. And again, as soon as this happens, all the members of the ledger are notified of the new owner of the product.

PoW and PoS - Proof-of-work and proof-of-stake are two of the most widely used methods for transaction validation. In PoW protocol, a member
