
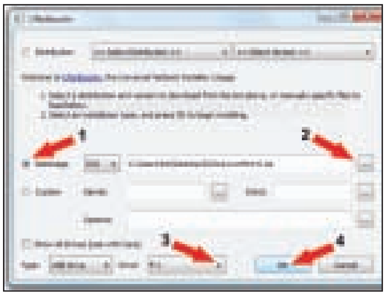
Using UNetbootin to create a Live USB Linux

files to the USB drive. And you need to do this in a specific way detailed below:

First mount the Ubuntu ISO:

If you have the CD, you can do so by `$ sudo mount /media/cdrom`. If you have an image file, you can do so by



Installing Ubuntu on a pendrive from an existing Ubuntu installationLinux

```
$ mkdir /tmp/ubuntu-livecd.
$ sudo mount -o loop /path/to/feisty-desktop-i386.iso /tmp/ubuntu-livecd
```

(Replace the ISO name with your Linux variant).

Next, mount the partitions of your pen drive:

```
$ mkdir /tmp/liveusb
$ sudo mount /dev/sdb1 /tmp/liveusb
```

Copy at the root of your USB drive's first partition:

The directories: `casper`, `disctree`, `dists`, `install`, `pics`, `pool`, `preseed`, `.disk`, the content of directory `isolinux` and files `md5sum.txt`, `README.diskdefines`, `ubuntu.ico` as well as files `casper/vmlinuz`, `casper/initrd.gz` and `install/mt86plus`.

```
$ cd /tmp/ubuntu-livecd
$ sudo cp -rf casper disctree dists install pics pool preseed .disk isolinux/* md5sum.txt README.diskdefines ubuntu.ico casper/vmlinuz casper/initrd.gz install/mt86plus /tmp/liveusb/
```

Also go to the first partition of your USB disk and rename `isolinux.cfg` to `syslinux.cfg`:

```
$ cd /tmp/liveusb
$ sudo mv isolinux.cfg syslinux.cfg
```

change `/tmp/liveusb` according to your settings

Next, you need to edit `syslinux.cfg` so that it looks like:

```
DEFAULT persistent
GFXBOOT bootlogo
GFXBOOT-BACKGROUND 0xB6875A
APPEND file=preseed/ubuntu.seed boot=casper initrd=initrd.gz ramdisk_size=1048576 root=/dev/ram rw quiet splash --
LABEL persistent
  menu label ^Start Ubuntu in persistent mode
  kernel vmlinuz
  append file=preseed/ubuntu.seed boot=casper persistent initrd=initrd.gz ramdisk_size=1048576 root=/dev/ram rw quiet splash --
LABEL live
  menu label ^Start or install Ubuntu
  kernel vmlinuz
  append file=preseed/ubuntu.seed boot=casper initrd=initrd.gz ramdisk_size=1048576 root=/dev/ram rw quiet splash --
LABEL xforcevesa
  menu label Start Ubuntu in safe ^graphics mode
  kernel vmlinuz
  append file=preseed/ubuntu.seed boot=casper xforcevesa initrd=initrd.gz ramdisk_size=1048576 root=/dev/ram rw quiet splash --
LABEL check
  menu label ^Check CD for defects
  kernel vmlinuz
  append boot=casper integrity-check initrd=initrd.gz ramdisk_size=1048576 root=/dev/ram rw quiet splash --
LABEL memtest
  menu label ^Memory test
  kernel mt86plus
  append -
LABEL hd
  menu label ^Boot from first hard disk
  localboot 0x80
  append -
DISPLAY isolinux.txt
TIMEOUT 300
PROMPT 1
F1 f1.txt
F2 f2.txt
F3 f3.txt
F4 f4.txt
F5 f5.txt
F6 f6.txt
F7 f7.txt
F8 f8.txt
F9 f9.txt
F0 f10.txt
```

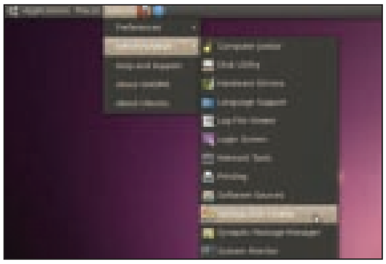
We are almost done. Now, the last thing that needs to be done is: making the usb bootable. For this, you need to install syslinux and mtools by:

```
$ sudo apt-get install syslinux mtools
```

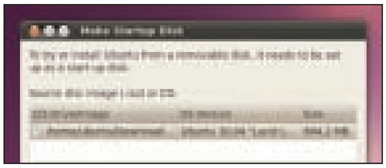
Then `unmount /dev/sdb1` and make it bootable:

```
$ cd
$ sudo umount /tmp/liveusb
$ sudo syslinux -f /dev/sdb1
```

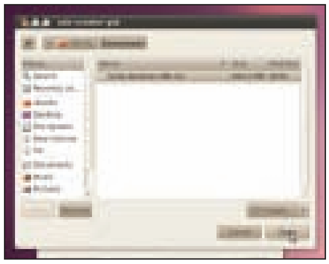
And, you are done!



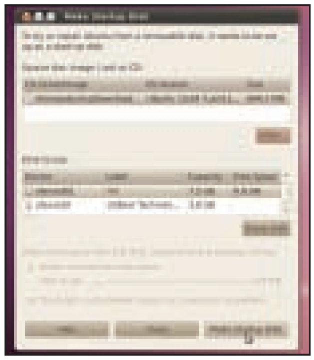
Click on 'Other' to choose the ISO file



Select the file and click on 'Open'



Select the USB stick in the bottom box and click on 'Make Startup Disk'



No commands, no unmounting drives, creating partitions, installing additional software
