```
}
```

In the above example, when 'a' is greater than 'b', then it executes the statements within { } after the keyword 'if'. Otherwise, it executes the statements within { } after the 'else' keyword.

One can also use the 'if' statement within another 'if' statement or within an 'else' statement. This is known as 'nested if' concept. For example, if we want to find out the greatest out of three numbers stored in three variables, the code will be as follows:

```
if(a>b)
{
 if(a>c)
 {
  cout<<"the greatest number is=";
  cout<<a;
 }
else
 {
  cout<<"the greatest number is=";
  cout<<c;
 }
}
else
{
 if(b>c)
 {
  cout<<"the greatest number is=";
  cout<<b;
 }
else
 {
  cout<<"the greatest number is=";
  cout<<c;
 }
}
```
