Through the app, you can track your cash flow, track multiple accounts and cards, and use search filters to pinpoint transactions if need be. These are premium features however.

Wallet requires you to sync your bank account with the app, which may or may not be a deal breaker for some. However, this feature does save time on manual updation of your expenditure.

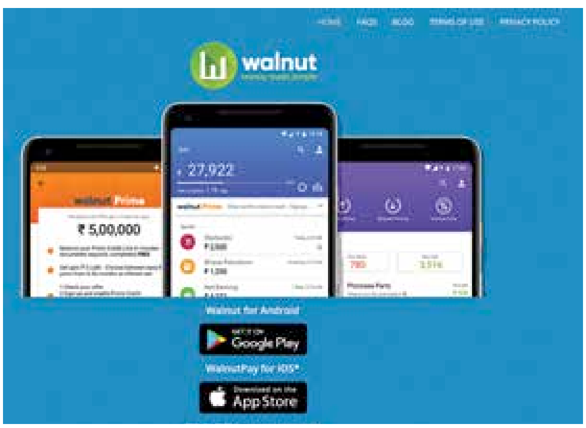
Linking your credit card with the app will allow you to track credit balance as well. Additionally, you can share select accounts with family members as well (also a premium feature), if for example, you want to create a group budget. Wallet works on browsers as well, which uses the same login information as the app.

If you've got previous instances of budget tracking, i.e., sheets, PDFs, CSVs, they can be exported to Wallet.

While Wallet is free to use, you have limited features. To unlock all features you will either need to get the monthly plan at $6.29/month, or purchase the lifetime premium for a single fee of $31.99. Doing so will unlock Wallet Premium, which includes unlimited accounts, unlimited bank account syncs, multi-user collaboration, advanced charts and reports, tools, and widgets.

2. Walnut

Walnut is a free expense tracking app that uses SMS detection to automatically track your expenses. The app is supported by more than 50 banks. It knows which SMSs to track, and ignores non-transaction related SMSs. However, some people are uncomfortable with this.



Walnut can also be used to split bills, in a manner similar to Splitwise, by allowing you to track individual spends. The app has also partnered with BHIM UPI, so you can use the app to make and receive UPI transactions as well.

Walnut will drop reminders about upcoming bills and also tracks credit card dues to ensure you're on top of your payments. It's also incredibly convenient because you can have all of your financial information in a single place. Through Walnut, you can track your bank balance, credit card dues, payment reminders, and digital wallets.

There are some other handy features as well, for instance, you can use Walnut to find a nearby ATM, and thanks to its SMS detection, it can track travel and movie bookings as well, and even drop reminders.

Walnut also has a premium version, Walnut Prime.

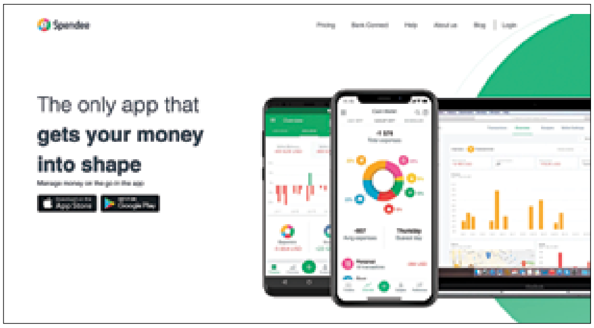
3. Spendee

The third and final budgeting app we're covering is Spendee. What sets Spendee apart from the previous two apps is the fact that Spendee, using AI, periodically provides you financial advice.

The AI can gauge when you're saving enough money, knows if you're overspending, and gives you an idea of how much you should actually be spending if you want to save as much money as the goal you've decided for yourself. The AI analyses how much you earn in a month on average, and provides you with figures on what you should spend, save, and even invest.

The app also advises on having an emergency fund, and predictions on how cash flow is looking and estimates on how much you will save in the coming months.

The app can sync with your bank accounts, and refreshes transactions automatically. However, you can choose to do so manually as well. Once you've synced, it organises your transactions into categories automatically. You can however edit these to your preferences. In addition to bank accounts, Spendee can connect to crypto and e-wallets as well.



Other than that you've got the usual features, such as budgeting and payment reminders.

Spendee also has support for multiple currencies.

A LITTLE BIT ON INVESTING

Following the rules above, if you're at a point where you have enough capital just sitting around – the loss of which will NOT affect your financial stability in any way – it might be a good idea to invest that money. When you invest, you're essentially making the money work for you, making back more money in the process. However, this is not always a sure thing. The future (like the current situation we're preparing for) is unpredictable. And investment relies purely on the future to make your profits. So make sure you do your due research before getting into investing. There are different kinds of investors with different investment goals, with different levels of risk involved. So once again, research carefully before taking this step. d
