- `sudo apt-get install Python-opencv`

If you're unable to install the OpenCV library, you can check the source installation method at *http://dgit.in/1FA6TNu*

Create a Python script that will help detect your face from the webcam input. Open the terminal and type:

- `nano face _ detect.py`

Famous Lemma image for face detection

Next, enter the following code in the editor that appears on the screen.

```
• import os
• import
• cv2cv2.NamedWindow('image')
• while True:
• os.system('fswebcam -r 1024x768 -S 3 --jpeg 50 --save /
home/pi/Desktop/image.jpg')
• frame = cv2.imread("/home/pi/Desktop/image.jpg")
• gray = cv2.cvtColor(image, cv2.COLOR _ BGR2GRAY)
• faces = faceCascade.detectMultiScale
• (gray,
• scaleFactor=1.1,
• min Neighbors=5, minSize=(10, 10),
• flags = cv2.cv.CV _ HAAR _ SCALE _ IMAGE )
• for (x, y, w, h) in faces:
• cv2.rectangle(frame, (x, y), (x+w, y+h), (0, 79, 255), 2)
• cv2.ShowImage('image',frame)
• k=cv2.WaitKey(0);
• if (k == 'ESC'):
• break
• cv2.DestroyWindow('image')
```

After entering the code, press [Ctrl] + [X] and then [Y] and finally the [Enter] key. This will save the code.
