```
}
```

The output of the above program is as follows:

```
7
```

Three variables of integer type are declared in the first line of the program above. Next, the value '2' is assigned to 'x' and '7' is assigned to 'y'. Further, a conditional operator is used. If the value of 'x' is greater than that of 'y', then 'x' is assigned to 'z', else 'y' is assigned to 'z'. Here, the value of 'x' is not greater than that of 'y'. Therefore, the value of 'y' (7) is assigned to 'z'. Finally, the value of 'z' is displayed on the screen as seen above.

● Comma operator

The comma (,) is regarded as the Comma Operator and is used to separate two expressions.

Example:

```
x = (y=3, y+2);
```

In the above line, 'x' and 'y' are two variables. Here, `y=3` and `y+2` are separated by a Comma Operator.

● Bitwise Operators:

Symbols that are regarded as the Bitwise Operators are: `&, |, ^, ~, <<, >>`.

These are used to modify variables that can consider bit patterns and can represent the values stored by them.

Operator	asm equivalent	Description of the Operator
&	AND	Bitwise AND
|	OR	Bitwise Inclusive OR
^	XOR	Bitwise Exclusive OR
~	NOT	Unary complement (bit inversion)
<<	SHL	Shift Left
