3. **Monitoring the progress of the animation:** For notifications regarding the changes of starting, reversing direction and stops, AddStatusListener is used. Running an animation in an infinite loop reverses its direction. This should be done once the animation has either returned to its starting state or is completed. A breathing effect is created with this.
4. **Refactoring with Animated Builder:** AnimatedBuilder knows how to render the transitions but not the widgets and Animation objects. BottomSheet, TabBar, ExpansionTile, Scaffold, Textfield, PopupMenu, ProgressIndicator, RefreshIndicator are some of the examples of AnimatedBuilder in API.

   If a change in animation requires a change in a widget that renders the logo then it a better option to separate the work into different classes.
   - Render the logo
   - Define the animation object
   - Render the transition

   This is accomplished using the AnimatedBuilder because it is a different class in the render tree. The notifications are automatically heard by the AnimatedBuilder from the Animation object, just like AnimatedWidget. The Widget tree is marked dirty by AnimatedBuilder as per the necessity, so addListener ( ) does not need to be called.
5. **Simultaneous animations:** A different aspect is managed by each Tween. You can get the size and opacity with sizeAnimation.value and opacity animation.value. A single Animation object is taken by the constructor for the AnimationWidget. For the encapsulation of its Tween objects, the AnimatedLogo needs to be changed. On the parent's animation object Tween.evaluate( ) is called by the build( ) method for calculating the opacity value and required size.

Next Steps

There are many other classes, other than Tweens, that can be used to create animations in Flutter. There are specialised Tween classes, ReverseAnimation, fling methods, specific animations of material design that can be further explored.

Internationalisation of the applications

Imagine that, for newly developed application of yours, the only difficulty you are facing is from the client's perspective. What if there is a language barrier?
