was enlisted as a talk subject on freenode IRC (an open source venture discussion) and the discussion developed.

The Bitcoin market was established in October 31 2009 and it allowed people to exchange paper money for Bitcoin. This is when individuals start to remember it as a computerized form of cash.

In May 2010, the main Bitcoin buy was of 10,000 bitcoins for a pizza. By November 2010, participation in the Bitcoin marketplace increased the market cap to exceed $1M USD. By Febuary 2011, BTC kept on expanding in esteem and achieved equity with USD ($1 USD= 1 BTC) and by March 2013, BTC market surpassed $1B USD. 10x growth in less than 3 years!

Satoshi claimed to have solved the problem of 'double spend' in digital currency using the blockchain technology in Bitcoin. Double spend is basically the idea of spending digital currency in two places. This is a problem which is specific to digital types of money since it can be copied or produced again easily. This would not be an issue for physical money since it cannot be easily copied and the parties involved in the transaction can easily verify them. In case of digital currency, there is a risk that the holder of the currency could make a copy of the digital currency and send it to the merchant or someone else while holding the original. Bitcoin became the first digital currency to have solved this problem of double spend without requiring a third party or a trusted administrator.

Satoshi Nakamoto vanished from the open (that is from Bitcoin discussions, papers and code contributors) in 2011. Bitcoins, however, kept on being created and marketed by the group which was engaged to address different issues in the code, even during his non-appearance. Bitcoin is used by millions of people for payments, including growing remittances market and its market capitalization hovers between $20-$25 Billion US Dollars.

It was in 2014, that people acknowledged that Blockchain can be isolated from the money and can be connected to different other use-cases. This is the point at which the attention moved from Bitcoin to Blockchain. Relatively every major monetary foundation on the planet is looking into blockchain now and some 15-20% of banks are required to utilize blockchain in the present year.

Smart Contracts

The next development exemplified in the second era was a blockchain framework called Ethereum that led to "Smart Contracts".
