```
using Microsoft.Extensions.Hosting;

public class Startup {
    public void ConfigureServices(IService
Collection services) {
        services.AddControllersWithViews();
    }

    public void Configure(IApplicationBuilder
app, IWebHostEnvironment env) {
        if (env.IsDevelopment()) {
            app.UseDeveloperExceptionPage();
        } else {
                app.UseExceptionHandler("/
Home/Error");
            app.UseHsts();
        }
        app.UseHttpsRedirection();
        app.UseStaticFiles();
        app.UseRouting();
        app.UseAuthorization();
        app.UseEndpoints(endpoints => {
            endpoints.MapControllerRoute(
                name: "default",
             pattern: "{controller=Home}/
{action=Index}/{id?}");
        });
    }
}
```

2) Game Development:

C# is the primary language for game development using the Unity engine, one of the most popular game development platforms.

Example: A simple Unity script

```
using UnityEngine;

public class HelloWorld : MonoBehaviour {
     // Start is called before the first
frame update
    void Start() {
        Debug.Log("Hello, World!");
    }
}
```

3) Desktop Applications:

C# is commonly used for building Windows desktop applications using the Windows Presentation Foundation (WPF) and Windows Forms.

Example: A simple Windows Forms application

```
using System;
using System.Windows.Forms;

public class HelloWorldForm : Form {
    public HelloWorldForm() {
        Text = "Hello World Form";
        Button button = new Button();
        button.Text = "Click Me!";
        button.Click += (sender, e) => {
         MessageBox.Show("Hello, World!");
        };
        Controls.Add(button);
    }

    public static void Main() {
          Application.Run(new HelloWorld-
Form());
    }
}
```

4) Cloud Services:

C# is used for developing cloud services and applications using Microsoft Azure. It allows developers to build, deploy, and manage applications in the cloud efficiently.

Example: Creating an Azure Function

```
using System.IO;
using Microsoft.AspNetCore.Mvc;
using Microsoft.Azure.WebJobs;
using Microsoft.Azure.WebJobs.Extensions.
Http;
using Microsoft.AspNetCore.Http;
using Microsoft.Extensions.Logging;
using Newtonsoft.Json;

public static class HttpTriggerFunction {
    [FunctionName("HttpTriggerFunction")]
   public static async Task<IActionResult>
Run(
            [HttpTrigger(AuthorizationLevel.
Function, "get", "post", Route = null)] Htt-
pRequest req,
          ILogger log) {
        log.LogInformation("C# HTTP trigger
function processed a request.");

          string name = req.Query["name"];

            string requestBody = await new
StreamReader(req.Body).ReadToEndAsync();
             dynamic data = JsonConvert.
DeserializeObject(requestBody);
          name = name ?? data?.name;

          return name != null
```
