

The FUSION of Communication

Interested in messages anywhere, anytime? Then unified messaging is probably for you

RINKI BANERJI

The phone lines in your company are down and you simply have to contact your public relations agency in the next half-hour. So you send an e-mail hoping that the person at the other end checks the message. But the PR agency is trying to cope up with a systems crash. And yet the recipient gets your mail and acts according to your instructions. Now how did that happen?

Welcome to the world of Unified Messaging (UM). This is the integration of real-time com-

munication that allows you to receive any form of message by retrieving it via telecommunication devices such as local phones, any Internet machine, fax machine, e-mail account, pager, handheld device, Windows PC or SMS/PCS mobile phones. All messages sent to you in various formats such as e-mail, fax or SMS, fall into a single inbox from where you can retrieve them. There are many services available on the Internet that let you have a single inbox or 'messaging centre' on the Web for all types of messages, letting you access your messages online. →
