

Putting the 'M' in Media

The world of multimedia beckons. But before you start off on your journey, make sure you fill your knapsack with these useful tid bits

NILESH KAKADE

The world around you isn't the same anymore—everything's getting interactive. Look around you and you will be amazed by the power of the digital world. Split second images flashing at you; screens responding to your touch and intelligent enough to respond to the next level of interaction; games, movies and other information-related products that really set you on a high...the excitement never ceases. It's a world almost without any boundaries, limited only by your imagination.

The name of the game then, is multimedia. A combination of text, graphics and sound working together to give you a mind-blowing experi-

ence. An experience that makes you wonder—how do they do it?

Skill set: the ground work

Producing a multimedia package involves a number of stages. Up first is the storyboard, which involves the creation of a work sheet that describes in minute detail the structure of the multimedia content and how the images, video, animation and sound are to be integrated. The storyboard also describes the workflow for your project. All the team members involved with the project work in accordance with the storyboard. A slight variation from it and the whole project could go haywire.
