

it to be automatically detected). Now, you should have your Standby option back.

Windows

+ Missing files

Whenever I start my computer I get an error message that a file dfs.vxd needed to run Windows or Windows applications is missing. To which application does this missing file belong and how do I get it back?

Aniket Gomase,

Via e-mail

R The missing file is part of your Windows operating system, and the error you get normally occurs when you change the Network logon method (say from Windows Family logon to Client for Microsoft Networks). You can extract the file by running sfc from Start > Run in Windows 98 SE. The file is located in net9.cab file of your Windows 98 installation.

Alternatively, if there is no need for this file, you can search the registry for instances of this file and delete the registry key. Remember to back up your registry before you make any changes to it. To edit the registry, go to Start > Run and type regedit.

In the menu that comes, find (Edit > Find) the string dfs.vxd and delete the entries that come up.

Applications

+ Not dat movie

I have a problem in playing the *.dat files. I tried all software like Windows Media Player, Jet

Audio, VCD Cutter and others. But the problem is that I hear sound but see no picture. I am unable to see any of the movies. I can play all other file formats like *.avi with no trouble at all. I tried reinstalling Windows too and running virus scans. Please help.

Abhijeet Bhandwale,

Via e-mail

R Reinstall your Windows Media player or alternatively download the Xing Mpeg player and try running that. This should solve the problem.

Windows

+ Studio crash

While working in Windows Explorer, I get the following error: "Explorer found an error in PDM.DLL. If you face more problems try restarting your computer." What is the cause of the problem?

Manish Sharma,

Via e-mail

R This problem can occur if you are running Microsoft Visual Studio version 6.0. Pdm.dll is a Process Debug Manager file, and gets installed with applications such as Visual Studio (Visual Basic or Visual C++).

To solve this problem, you need to have the Service Pack 3 of Visual Studio installed. You will locate this at the Microsoft site. Alternatively, you can simply try renaming the Pdm.dll file from the Windows > System folder.

Windows

+ Direct Touch

I have two computers, one is a Pentium-200 and the other is a P-III 700. I was told that the two computers can be attached through a null-modem cable. Accordingly, I have done so using a 9-pin cable.

When I run the direct cable connection from Accessories they both get connected, after which the guest computer asks for the name of the host computer. When the name is keyed in, a message that no such computer is found on the network, flashes. But from the Start Menu, through the Find Computers option, if I key in the name of the computer, it displays the computer's icon.

This, the other computer is unable to find. Even after reversing the roles of the computers the problem exists. Also, the computer's icon is not displayed in Network Neighborhood. Please advice me.

Mukund,

Via e-mail

R For Direct Cable Connection (DCC) to work properly, you need to do the following:

1. Install DCC on both the computers through Control Panel > Add/Remove Programs > Windows Setup tab, and select the Communications option, click on Details and select DCC.

2. Install Client for Microsoft Networks and enable File and Print Sharing through the Network Neighborhood icon on the desktop. Right-click on the Network

Hardware

+ Games people play

I have a P-III system with 128 MB of RAM and 8 MB shared video memory. It also contains onboard 64-bit 3D Graphics Accelerator. I installed OpenGL and tried running Quake III Arena, but received a message saying, "Missing Glide Installation-Assuming no 3D fx. Could not load Open_GL subsystem." Please solve my problem.

Kevin,

Via e-mail

R When this error occurs, usually the option is to do a clean reinstall of the video drivers (that is remove the video drivers and then install them again). But as you are using an onboard graphics accelerator (not specified) it may or may

not have native support for OpenGL. Games like Quake III Arena, Quake II, etc require the display card to support OpenGL natively. If you are consistently

Illustrations: Farzana Cooper

getting this error then crosscheck whether your card is supported by Quake III Arena. All the cards that are supported by Quake III are mentioned in its Readme file. Another way to find whether your card has some OpenGL capabilities or not is by going to the following link: www.opengl.org/users/apps_hardware/accelerators.html.

Here, you'll find a comprehensive listing of all graphics cards that are supported. You can also download the latest version of the OpenGL drivers from here. GLSetup detects your 3D graphics card and installs the matching OpenGL drivers. Games supporting OpenGL will include GLSetup to ensure your system has drivers available to accelerate OpenGL 3D rendering. should successfully detect and rid your PC of the virus.
