

options include changing the configuration from Plugins > Output. You will get the Nullsoft waveout plugin settings box. In the Buffer length options you should move the slider to the maximum, and in the Advanced Settings option, depending on your system configuration set Priority to Time Critical

Maximum blocks = 32

Maximum block size = 64 KB

Minimum block size = 32 KB

Click OK to activate the settings.

Using MusicMatch with portable MP3 player

It's possible to use the MusicMatch software along with your portable MP3 player. To do this, go to the Options menu and select Add New Features. Next, click the link to the portable MP3 players and then download the software for your specific player.

Windows Media Player

This free media player, like the Internet Explorer browser, will form an integral part of the Windows operating systems. So, get used to working and tweaking it to the optimum

Batch update your track information

Often you may want to change certain parameters such as the naming in an entire album or the category of the songs or the artistes' names. This can be done quite easily by going to the Media Library option and selecting the items that you wish to rename. Now, just right-click and select the Edit Selection option to change the items.

Create multimedia playlists

Most of us just think of playlists as containing songs. However, it's possible to add more items to a playlist such as video, music, or even radio stations. So, you can make one playlist with all your favourite Hindi songs, and then add the radio channel on the Net that plays Hindi songs. So, when the songs playlist ends, and if you are connected to the

Internet, you will automatically get the next song from the radio station.

Listening to music

Windows Media Player has a number of preset radio stations that you can use to listen to music. The presets are not just restricted to one country, but cover many including some European ones. Depending on your preferences you can change the location of the media guide. Just click on the location link and change it to the one you want.

Accessing music from network

In an office environment often there's one computer that has all the music files on it. You can easily access this network computer or search the files within from Windows Media Player. Firstly, map the network drive where the music files are located. Then from Windows Media

Searching the Network for MP3 media

option, click on Change to point to the network drive.

Enhancing compression while porting

When you are transferring MP3 files from your Windows media player to your portable MP3 player, you can always select to downsample your current MP3s and yet get near CD-quality. To downsample a song, go to Tools > Options and select Portable Device. From there, go to Select Quality Level and move the slider to 64 Kbps or even lower. This will enable you to store more files on your device.

Ensuring compatibility with portable devices

You can easily check out the list of portable devices that Windows Media Player supports from the Tools > Options > Portable Devices menu. Once here, go to Currently Supported Devices and then click on Details to get the list. Copying files to your portable device is very simple. Select the songs from your playlist, click the Portable Device option, and then click on Copy music to transfer the files.

Copying audio tracks from a video clip

If you happen to be watching a movie on your Media Player and you like the audio track, you can easily port it to your portable player even though it is in video format. Just transfer the file and Windows Media Player ensures that the audio track gets copied to the portable device.

Wanna rush for your Philips

Player, go to Tools > Search Computer for Media and select the drive that you have mapped.

Specify the songs, and it will now search for the title name from your computer. For saving music files, you can ensure that it automatically gets archived on the network drive. Go to Tools > CD Audio and from the Archive
