

Troubleshooting FAQs

Disabling a program

Q After installing programs such as MSN Messenger, Yahoo Messenger and Adobe Acrobat Reader I find that my computer takes a little longer to completely load Windows. I assume it is because even these programs load up on start up. I do use these programs, but I don't want them to load up automatically. How do I fix that?

Harish

Via e-mail

A You can use these programs without them starting up automatically while loading Windows. All you have to do is go to Preferences in each of these programs. You will find an option, which asks whether you would like to run the program automatically on starting Windows. Simply disable that option and the program will not start on its own. In case you have a program that does not support this

Windows 2000 on my machine and now whenever I click on My Computer it takes a while to open up. Sometimes even when it opens it fails to display my CD-ROM drive. At other times the CD-ROM drive is displayed and it works fine. This never happened while I was using Windows 98. Where exactly does the problem lie?

Shweta

Via e-mail

A There is nothing wrong with your CD-ROM drive. The problem lies with Windows 2000 and the BIOS of your motherboard. It seems that you have not upgraded your BIOS prior to installing Windows 2000, as a result of which the BIOS fails to detect your CD-ROM drive. You will have to go to the manufacturer's Web site and flash your BIOS. You will not face this problem again.

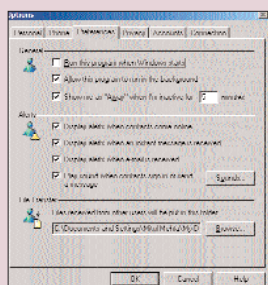

Removing Nimda

Q My computer has been infected with the Nimda virus. I installed Norton Antivirus but it failed to detect some of the infected files. The ones that were detected have been quarantined. Can you suggest a way to completely remove the virus?

Suman

Via e-mail

A To completely remove the Nimda virus you will have to download a removal tool specifically created to remove this virus. You can download the tool from www.pandasoftware.com and run it to remove all strains of the virus.

Disable MSN Messenger from startup

option, go to **Start > Run** and type in **msconfig**. A small program will open up, which allows you to disable your start up programs.

Missing CD-ROM drive

Q I recently installed

run Red Hat Linux 7.0, Windows 98 SE and Windows XP (Professional) on it. My internal modem (HSP56 Micromodem) does not work

in Windows XP (but works perfectly in Windows 98 on COM4). Although it shows as working properly in the device manager (on COM3), the moment I double-click on the connection icon, a message saying 'Opening port...' appears and the system hangs. After that it doesn't respond to any keys and I have to reset it manually. I have tried changing the modem IRQ. Is there a solution?

Bobby Sherique

Via e-mail

A In order to get your modem functioning properly in Windows XP you should download the latest software (internal modem) drivers for your chipset. In case the manufacturer hasn't developed any drivers for Windows XP you can download and install the Windows 2000 WDM drivers and your modem should work fine.

Soundcard error

Q The following lines are present in my Autoexec.bat file:
SET BLASTER=A220 I5 D1 H5 P330 T6
SET CTSYN=C:\WINDOWS C:\Program Files\Creative\SBLive\DRV\Sbeinit.com
During boot up the Sbeinit.com file shows me the following error:
Creative SB16 Emulation Driver. Version 4.00
SB IRQ conflicting with PCI IRQ
Creative SB16 Emulation Driver not loading
But my soundcard works fine. How do I get rid of this error message?

Sarathy

Via e-mail

A In order to get rid of the error message, go to your BIOS settings and make sure you allot your soundcard to

IRQ5 PCI/ISA bus. This can be done through the PNP/PCI option in the BIOS. The settings indicated in the Autoexec.bat file are meant for plain DOS mode for playing DOS-based games or running DOS-based audio programs. If you don't play such games, you can safely remove these commands from the Autoexec.bat file.

BIOS baffler

Q When I start my computer, after the memory check and the detection of the primary master and slaves, it stops and shows a message that says, 'Checksum Error - Defaults Loaded. Press F1 to continue'. What is the solution to this?

Manu Iyer

Via e-mail

A The error message that you get could be because of two reasons. Either your BIOS battery is discharged (or your battery is dead) or your BIOS is corrupt. To solve this problem, first try to clear your CMOS settings by locating the 'CMOS clear' jumper. Use your motherboard manual to locate the exact position of the jumper. In case there are no jumpers, but there are two points, then short them. Once you have cleared your BIOS settings, reboot your machine. If the error continues to appear, shutdown your machine and try changing your battery. If the error still appears, it means your BIOS is corrupt and you will have to flash your BIOS. If you are not sure how to flash a BIOS, do not attempt to do it by yourself as you might render the motherboard useless. So if your computer is working just fine even with the error message, simply ignore it.

Moody modem

Q My system has a Pentium III, 800-MHz processor on an Intel 810e-based motherboard with 256 MB RAM. I currently
