Setting your Mail Client

In Outlook Express choose 'Accounts' from the 'Tools' menu to add a new account. Enter 192.168.0.1 (IP address of Home1) as the incoming and outgoing server. Specify the account name and the password that you've set in the mail server. Now you can send and receive local mails even when you're not connected to the Internet. Remember, however, that all Internet mails will be queued in the server's Queue folder, but local mails will be immediately delivered.

Adding users

The postmaster and the daemon accounts are fictitious users that help send and receive e-mails. Make sure that you don't delete or modify them. Click on the 'Add' button to create a user account for everyone on your network. If you assign a user as Boss, a copy of every local mail will be sent to that person. Avoid this setting unless you want to monitor what mails go in and out of the mail server.

Set the delivery options

Now all you need to do is set up the e-mail account(s) from which mail will be downloaded. As soon as the mail from these accounts are downloaded, they will be delivered to appropriate users based on the transaction options you have set.

Set up your external POP3 accounts

based mail service provider needs you to login to use the SMTP service, click on the 'SMTP login' button and enter the necessary details.

Clicking on the 'Add' button will open a new window where you need to provide details for your POP account.

Specify the address where mail should be forwarded

Once online, do a 'Send/Receive' from the main window and all your queued messages will be sent and all new messages from each of the POP accounts that have been set up will be downloaded. The mail will now be sorted and distributed as per your settings.

These are just some of the things you can do with your personal network. As you become more familiar you will be amazed at what can be accomplished when you connect to conserve resources.
