

is entered. The format is one text line followed by two hyphens and then another text line, and so on.

■ Choosy images

Some images may not suit the startup screen. The same is applicable to the other screens as well. So if you want the software to use a particular set of images for the startup screen and different sets for standby and turnoff screens, configure 1st Impression to do so.

Select the group of images from the gallery by clicking on them while keeping the [Ctrl] key pressed. Now press [P] or click on 'Choose position' under the Image menu. This will open a small window with three options: 'Startup', 'Standby' and 'Turnoff'.

Select one or a combination of options depending on which screens you want to use the selected images for.

■ Restore defaults

If you want to revert to your old Windows logo screens, you can restore them by choosing 'Restore Original logos' from the Tools menu. If that doesn't help, go to C:\Windows\Logos.bak backup folder and double-click the 'restore.bat' file. This will copy the old files to their default locations. If you are a DOS expert, you can edit the batch file and see the contents.

WinLogoChanger

WinLogoChanger has some options which 1st Impression lacks. WinLogoChanger

does not require any installation as such; just unzip the files to a folder and click on 'winlogo.exe' to start the program

■ Automating startup/shutdown screens

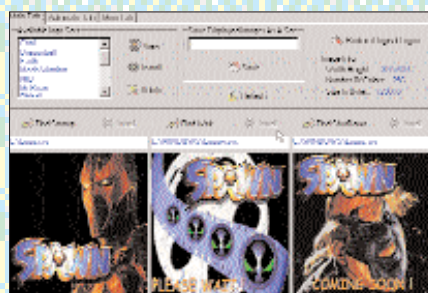

WinLogoChanger gives you a wide option for setting the automation method for changing the startup/shutdown screens. You can choose to change the screens after 'n' number of boots or 'n' number of days (where 'n' can be any number between the permissible limits of the software). You can also change the screens on specified dates. These options are available under the 'Automation' tab of WinLogoChanger.

■ Save your logo sets

You can create your own sets of logos and use them. (*Learn more about this in the 'Theme managers and creators' section*). The main window of WinLogoChanger displays the current logos on each of the three startup/shutdown screens.

To save the current set of logos, enter an appropriate name in the 'Save Displayed Image as a Set' text area and click on the 'Save' button just below that text area.

The logos will be grouped and saved in a subfolder within the same folder in which 'winlogo.exe' is located. Once it's saved, the group name is listed on the 'Available logo sets' in the main window of WinLogoChanger. You can choose different combinations of

logos and save them under different names. You can also select and install a set from the available logo sets.

Save the image for your logo

JAZZY SCREENSAVERS

Screensavers, initially meant to prevent monitor burnouts, are the PC user's ultimate statement of style

Power Screen Saver Builder

You can download screensavers from a number of sites. But if you want to add a truly personal touch to your desktop, create your own screensavers. Power Screen Saver Builder allows you to do just that. It's simple to install and use

■ Creating a screensaver

Launch the software. The

main window of the application will show you five tabs: Normal, Media, Music, Setting, and Output.

Click on the 'Normal' tab to name the project (eventually, the screensaver will be created under this name) and add a description for your project.

Click on the 'Media' tab in the main window to add images, Flash files or even MPEG/AVI movies. These
