

Select the elements for making your screensaver

elements will form a part of the screensaver you are creating. Click on the 'Add images' icon, which allows you to choose the media files you want to add to your screensaver. You can also change the position of a file. Choose the file from the list and click on the up/down arrow until the desired position is reached.

Now to add some spice, let's sprinkle the screensaver with music. You can add music files from various formats, ranging from WAV to MP3. The process is the same as for adding images. You can also set the sequence of songs to be played when the screensaver is running.

The software has an option for settings which lets you change the speed intervals, enable/disable music, and do any other configuration changes to the screensaver.

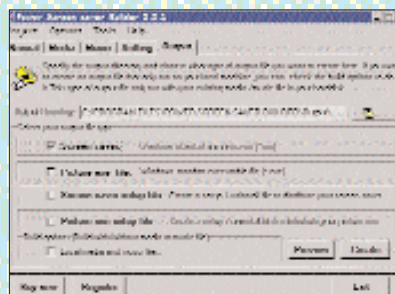

To enable this option, click on the 'Settings' tab in the main window and then click on 'Test setting'. A small window will pop up which will let you add settings information for your screensaver. Make the necessary

changes and click 'OK' to continue.

Click the 'Output' tab, which provides a variety of options to create screensaver files. You can create .scr files, windows standard executable files, screensaver setup files or even installable files for

windows executables. This might seem quite confusing.

Ignore the executable file creation options and select either the option to create .scr files or screensaver setup

Packaging your screensaver

files. Click on the 'Preview' button to test your screensaver before you finalise it. Specify the directory where you want the screensaver to be saved and click on the 'Create' button to create your own screensaver. Once you've done so, the software pops up a success note.

Click 'OK' and it will open the destination folder where the screensaver was saved. You are ready with your first screensaver now.

Set transition effects

You can set transitions from one image or movie to another by clicking the 'Properties' option under the 'Media' tab. In the window that pops up, select the 'Transition' tab.

You can choose from a multitude of options listed under this tab. Remember to set an optimal

Trim File Size

If you are using heavy music and movie files for your screensaver and want to use it only on your computer, select the 'Local media and music files' checkbox under the 'Output' tab.

This ensures that these files are not packaged within the screensaver; instead the files are saved in a separate location on the hard disk and only the references to the files are saved within the screensaver. This also ensures that the overall file size remains small.

transition rate—don't fill in an unrealistic rate. Faster transition rates may not allow you to view the images properly, which will ruin the entire fun of having a great screensaver.

Chaotic Chance

'Deselect all' button and tick one of the checkboxes to select a screensaver for preview. Next, click on the 'Preview' button. This will start

Manage your screensavers

This is a screensaver managing utility. Once installed, the software adds itself to your screensaver list. You can invoke the software either through the **Start > Programs** menu or through the **Display Properties > Screensaver > Settings** option. You will see a small window pop up. All the screensavers are listed on the left and you can preview each one of them. Click on the

the screensaver and you can see how it looks and feels.

This software also lets you randomise screensavers from the selected lot in the list. To choose a changing style, click on either 'Random' or 'Sequential'. Select one of the options against 'Change period', listed just below the 'Styles' option. Now your screensavers will be shuffled through at preset intervals.
