

A chip on your shoulder

Embedding chips in your body is not science fiction anymore.

Meet Jeff Jacob, who's getting a VeriChip embedded in his shoulder. He's in a critical state and requires medical attention throughout the day. The chip will actually help doctors attend to him if he has an emergency and is not able to speak. All that the doctor has to do is to read the chip using a spe-

cial scanner. In fact, his son and wife are also getting the

chip implanted in their bodies.

This chip made by Applied

Digital is about the size of a grain of rice and can be injected beneath the patient's skin. The chip stores the entire medical history of a patient. This is of tremendous help to doctors since they will have access to it even if the patient is unconscious or unable to speak.

These chips are not very expensive, and in the future might be coupled with GPS systems as well.

GeForce being scrapped

According to experts at Xbitlabs.com, the GeForce is dead! Yes, nVidia is planning to scrap the GeForce name altogether.

The NV30, nVidia's latest offering, will be using 3dfx technology. 3dfx was acquired by nVidia in early 2001. Now it seems that

nVidia is likely to use 3dfx's Rampage technology, which posed a threat to its new range of products. So we can expect the forthcoming nVidia products to have completely new architectures.

This is a path breaker as nVidia's new products are more or less modifications

to the previous product lines.

Wondering if this is a smart move? Well, 3dfx was the leader in graphics performance at one point of time. In fact, it had a cult-like status among gamers. If this happens, ATi had better pack up their bags!

Bugged with 'MyLife'?

Dubbed 'MyLife', this worm propagates across mail servers with its payload sent across as an attachment.

After infection, MyLife erases system files that are essential for operation. To remove this threat, update your virus scanner and run a system-wide check. Once complete, you will have to delete those files that are listed as infected. Now you need to make manual changes in the system registry. Click **Start > Run** and type **regedit**, then press OK. Navigate to the following registry key: `HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Run`

In the right window pane, locate the following key and delete it: `c:\windows\system\cari.scr`

Maldal malady

'Maldal.E' uses Microsoft Outlook to mail itself to all the contacts in your address book. The worm arrives in an e-mail with a subject line—this is the computer name of the infected PC that sent the message.

When executed, the worm copies itself to the `Windows\System` directory as `win.exe`. To remove this virus update your virus scanner, and be sure to delete the worm's registry entry. Go to the Registry Editor and search for a key that reads:

`HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Run\System = "%System%\win.exe"`

Delete this entry, save the changes, exit, and reboot.
