An issue of compatibility

Q. I recently upgraded to Windows XP Pro, but some of my old games and programs don't run in XP. What could be the problem?
Basant Kulkarni

Via e-mail

A You can get your legacy applications to work in XP by trying out the different compatibility modes. Right-click on your application's shortcut and in Properties, click the Compatibility tab to launch the Compatibility wizard. Select either the Windows 98 Compatibility mode or Windows 2000 Compatibility mode and see if your application works. If it doesn't work, try selecting the Disable Visual Themes option. If the application still doesn't work, try dual-booting your PC with Windows 98 or another OS that you know works with the app. Remember to first install the older OS and then the more recent one. For example, install Windows 98 first, and then install XP on another partition.

The Compability option allows older games to be played in Windows XP

Missing msconfig in Win2000

Q. I am running a PC with Windows 2000 Pro with Service Pack 2. After a spree of experimentation, I ended up with a lot of programs running on startup. As a result, my system takes ages to load. However, I cannot locate msconfig.exe in Windows 2000 for cleaning out the System Tray. Please help.

Anand Kukreja

Via e-mail

A Unfortunately, msconfig is not included in Windows 2000, but there is a way to check which programs are starting up with Windows and weed out the ones you don't want.

First of all, look in the Startup folder in your Start menu and delete the shortcuts you don't need. Next, go to the registry (click Run in the Start Menu and type **regedit**) and browse to HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\Current version\Run. Each key in this folder starts an application that runs every time Windows starts—remove the ones you don't need. However, we suggest that you don't remove any program that's located in the c:/winnt or c:/windows directory or any of their sub-directories. Also, as a general rule, retain any shortcuts that run toward RUNDLL32.EXE.

Dim memory

Q. I have a PC with a Pentium III 800 MHz processor. The motherboard is an 815 chipset motherboard. I recently upgraded my memory and installed a 512 MB RAM module in my PC. Though my system reads installed memory as up to 512 MB RAM, it shows as just 256 MB in the Windows 98 Control Panel. Why is this so?

I also experience hiccups when playing *Quake III Arena*, even though I have a 32 MB nVidia GeForce card. Even the audio gets
