

Business Contact Manager

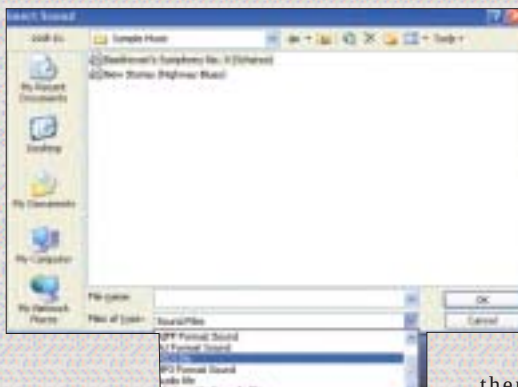

Outlook 2003 with Business Contact Manager makes small business owners and sales people more productive by enabling them to track their business relationships and sales opportunities in one place. Outlook 2003 with Business Contact Manager also helps small businesses connect to their customers through integration with List Builder, an e-mail marketing service from Microsoft bCentral, and to their business data through integration with other Microsoft Office 2003 applications.

blocks that connection until you decide to view the content, which takes only one click. This feature can also be turned off if the user prefers.

Contact picture: Pictures can be added directly into a contact, giving you the ability to associate a face with the name and other information in the contact.

Intelligent Connectivity: The Intelligent Connectivity feature introduces network awareness to Outlook 2003, giving it the ability to be more responsive over low-speed or unreliable network connections.

Expanded play list formats: PowerPoint now supports the following play list formats: ASX, WMX, M3U, WVX, WAX and WMA. Also, if a media codec (necessary to play the files) isn't present on the system, PowerPoint will try to download it using Windows Media Player technology.

Extended sound playing capabilities in PowerPoint

Annotations in slide show: PowerPoint 2003 has improved annotation support, allowing Tablet PC users to mark up slides with ink while in Slide Show. You can take notes on slides, and save the ink on the slides for later use.

PowerPoint has also updated the pen tools in Slide Show with more colours and types of pens to choose from, as well as giving you the ability to highlight parts of the presentation using a new highlighter tool.

PowerPoint viewer and package for CD: In PowerPoint 2003, in conjunction with the Package for CD feature, authors can package presentations onto a CD and optionally include the new

Packaging presentations for CDs

PowerPoint viewer. Now authors can distribute PowerPoint presentations without worrying if their recipients have the correct version of PowerPoint to view them. The package for CD feature also allows the author to choose to automatically play presentations once the CD is inserted.

Web Packages: You can package a portion of your Web site based on Microsoft Windows SharePoint Services Beta 2 into a functional module that other users can add to their site. For example, you can package a service solution that is specific to a certain type of business. You can then convert that functionality into a convenient single file format, and import it to other Web sites.

Publish view: You can use the Publish view to publish an entire Web site or to selectively publish individual files. You can also synchronise files between two or more locations—that is, make sure sites with the same content are up-to-date with recent changes.

When you view folder contents in Publish view, the files are marked with icons and descriptive text indicating the publish status, such as Don't Publish, Changed, Unchanged, New, and Conflict. You can filter the view to show the folder contents, files to publish, files not to publish, and files in conflict.

Quick tag selector and quick tag Editor: You can use the Quick Tag Selector, located just above the document window, to view all the tags in your Web page in a central location.

Interactive buttons: You can add professional looking buttons to your Web page by selecting from a list of JavaScript-based buttons. Once you have selected a button, you can change the settings, such as add the button text, choose the font, button colour, define a link and define the image and text settings for original, hover and pressed states.

Improved ways to view Web page content: With more advanced features in FrontPage, Page view types have been appropriately renamed to Design, Code and Preview views. If you are familiar with HTML, you can display the HTML tags in Code view and write and edit the HTML tags yourself. With the optimised code features in FrontPage, you can create clean HTML, and it is easier for you to remove any code that you do not want. You can now also view your Web page content in a split screen format called Split view. This enables you to review the content in both the Code and Design views as you edit your page content. If you are a beginner, you can learn HTML more quickly using Split view, because you are able to see the code develop in Code view as you work in Design view.

Optimise HTML: You can generate clean HTML code in your pages when you publish files from a Web site to a remote Web site. This means that you can reduce the size of a page by removing unnecessary formatting and tags, thereby optimising the code. Web
