SONY P72

As is obvious, the image produced by the Kodak DX6340 has good tonal balance all across—all the colours are vibrant, and the details immaculately reproduced. Whereas, the image reproduced by the Samsung 350SE completely lacks luminosity and is quite dark and dull. The photograph taken with the Casio Exilim had similar results

and the image lacked lustre. The images resulting from the Nikon 3100 shows good tonal balance and specular effects. Similarly, the Olympus C350 also reproduced the test scene with great detail, but lacked luminosity. The Sony images lacked details but had good colour balance.
