

CANON IXUS 400

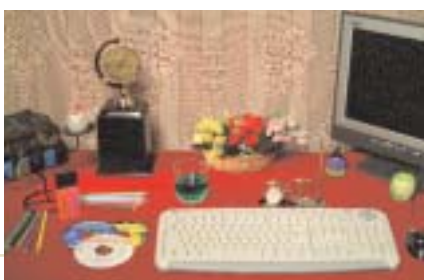

CANON S50

FUJI F410

FUJI F601

FUJI M603

FUJI S304

The Canon IXUS 400 gave good colour reproduction, followed by the Fuji FinePix S304. These were the two cameras that reproduced colours better than the others. Canon IXUS produced very decent and smooth-looking specular effects. The Fuji M603's reproduction was a little too harsh and shiny. All the cameras were closely competitive at picking up details and focusing, but Fuji S304 managed to capture every detail, as is apparent from picture where the individ-

ual thread in the curtains are visible. The wrinkles on the doll are clearly visible in the images taken by the IXUS, which was nearly on par with the Fuji S304.

The Canon S50, which is 5 mega pixel camera disappointed us in the luminosity test as the image was little dark. The pictures from both, the Fuji F601 and M603, are bright but not as focused and detailed as the IXUS 400 and the S304.
