

currency format, the number of digits after which a comma should be placed, and so on.

Once all the settings are complete you need to create the accounts for the various income, expense and other groups. At the very least, you need a bank account, cash-in-hand, credit card and salary account, plus a few additional expense accounts such as transportation, clothes, etc. To create your first account, the Bank Account, go to **Ledger > Chart of Accounts > New**. Here, specify the account name, say Savings Account, and select the account type as Bank. Press Next to create more accounts in a similar way.

The default account type for Salary should be 'Income', for credit card 'Credit Card', and for expense accounts 'Expense'. Quasar does not have a pre-defined 'Cash' account type, so to create a cash-in-hand account you will have to specify the account type as Cash.

Once you have all the accounts created, the next task is to enter all the transactions one by one. To insert a transaction, you need to press the Journal Entry within Ledger. The entry page is not as simple as that of GnuCash. The ID field has a value of '#', meaning it will take the next free ID from the database. The memo field is the description field for the entry, so you can enter a small description here. You can select the account you need to debit or credit by first clicking in an empty cell within the Account column and then pressing [F9]. This software varies from GnuCash in terms of debit or credit here too: in GnuCash you can see simple columns such as receive and give, but here, you get the standard screen with a debit and credit column.

Let's start with the salary transaction. Specify the date when you receive your salary, put in a description in the memo field, and select the Salary account. Specify the amount in the Credit column, go to the next row, select the Savings Account, and specify the same amount in the debit column.

Note that the Debit total and the Credit total should be same in the right bottom part of the window. Press Next to continue with further entries. For the Salary account, money is going out, so it has to be credited, and for the Savings account, money has to be debited.

Now, to withdraw money, you need to credit the Savings account and debit the cash-in-hand account. To spend cash for books, the entry should credit the

'cash-in-hand' account and debit the 'books' account. A transaction dealing with credit cards requires two entries, the first debiting the expense account (for example, Books) and then crediting the Credit Card account, while the second repays the credit card bill by debiting the Credit Card account and crediting the Savings accounts. If you buy books worth Rs 624 using your credit card. The entry will look like:

First Journal Entry

Memo: Book shopping

Clothes: 624.00 Debit

Credit Card: 624.00 Credit

Second Journal Entry

Memo: Repayment of Credit Card bill

Credit Card: 624.00 Debit

Savings Account: 624.00 Credit

Similarly, you can carry on your daily transactions with the help of Journal Entries. As all your transactions are entered, if you realise that one of the previous entries was incorrect, correct the entry by clicking on Transaction Journal within Ledger. Select the 'Dates:' as 'This Year-to-date' and press Refresh. You will get all the entries. Just double-click on the entry to modify it.

To know your financial status at any moment you just need to view the trial balance, profit and loss account and balance sheet using the Reports menu. The Reports menu also contains a Transaction and a Report Listing. The Transaction report lists all the transactions that have happened. The Report List has more reports categorized into six sections—Card File, Ledger, Cheques,

Date	Memo	Debit	Credit
2003-08-01	Book shopping	624.00	
2003-08-01			624.00
2003-08-01	Repayment of Credit Card bill	624.00	
2003-08-01			624.00

Modifying a Transaction

Inventory, Sales and Purchases. The Ledger section contains trial balance, balance sheet and profit and loss accounts, plus an additional Account Listing. Account Listing report shows you the balance for every account in your company.

This software is not just a financial software solution; it is a complete solution for small business units with modules such as vendor billing, vendor claims, quotation and invoices, cheque writing and printing, sales and purchases, and so on—that is, an Inventory Management system.
