

Haunted computers, cameras that don't work, CDs that refuse to run, computers that won't shut down, or just upgrade advice... Tell us about it and we'll help you solve it

Camera can't find file

Q. I recently bought a Sony DCR-TRV355E USB and a Sony DSC-P8 USB camera. When I restart the machine, after installing the required drivers, I get an error message saying, "File USB-NTMAP.SYS is missing." This happens for both the cameras. Can you tell me what I'm doing wrong?

Abhinav

A Since the message says that the crucial file is missing or corrupt, the solution would be to replace the needed file—all you have to do is copy the file from the original Windows CD. Look for the file named driver.cab in Windows XP and 2000, or base2.cab in Windows 98 and Me, and extract and copy it. If you do not have the original CD, or if you can't find the file, go to <http://www.usb-drivers.com/drivers/49/49917.htm> and download the file of the same name for the version of

Windows you have installed.

Time for action

Q. Whenever I try to explore any folder including my CD-ROM drive, Windows displays an error message saying, "A run time error has occurred. Do you wish to Debug? Line: 0 Error: Type mismatch: 'KJ_start'." Can you help me?

Sharma Gourishankar

A Uh-oh! Looks like your machine is infected by a virus; you'll have to delete all the files with the 'htt' extension. The easiest way is to go **Start > Find** (or Search in case of Windows XP), type ***.htt** as the criteria and start searching. Once the search is complete, select all the files in the search window and press [Delete].

Now that you've learnt your lesson, go to your anti-virus vendor's Web site, download the latest update and scan your hard drive.

Where's my graphics card?

Q. I have a PC with a Pentium 4, 1.5 GHz, 128 MB DDR RAM, a 40 GB Samsung hard drive and a Mercury KOB 845G/GL NDSMx motherboard with an Intel chipset, and onboard sound and video. My problem is that whenever I try to install Linux 7.2, it does not recognise my video card. Linux 7.2 does not list my

motherboard in the list of in-built drivers. Where can I find the required drivers for my video card?

Saumik Pal

The KOB 845G/GL NDSMx motherboard is supported by newer versions of Linux

A If you are really attached to your version of Linux, and do not want to upgrade to a later version, you can download precompiled binaries in the rpm format from <ftp://aiedownload.intel.com/df-support/6080/eng/dripkg-1.0-4.i386.rpm>. If you want to compile the code yourself, go to <ftp://aiedownload.intel.com/df-support/6185/eng/20030425-i386.tar.gz>, and get the readme file from <ftp://aiedownload.intel.com/df-support/6080/ENG/readme.txt>.

On the other hand, since your PC configuration is definitely good
