

want to give the permission. Also, the checkboxes will be altered if you try to give some inconsistent choices, such as assigning the Write permission without the Read permission. Give Full Control permission to the Designers, and assign rights to other users and groups based on their need. You can make the administrator view the files, but not modify it, etc. Once you are finished with the folder for Designers, do the same for Accountants. Thus, you can ensure that the two groups don't meddle with each other's documents.

Now, if you want the applications to remain exclusive to a specific group, then you can do so by assigning rights over the folder where the application is installed. Go to the Security settings of the folder, and check 'Read & Execute'. Thus, both the groups will be in their separate worlds within the system.

Over the network

It is possible to control the number of users who can view your documents when you share it over a network. You can even share a folder that is visible over the network only to a specific user

Give the share name and assign rights to users over the shared folder

such as the auditor in our example. First, you have to create a user in your local system for the auditor, using which he or she can access the folder. Don't forget to password-protect the account, or else anyone can log in using that username. Then, create a folder within the accountant's directory, which will be shared with the auditor. Right-click the folder, and select 'Sharing and Security'. Select Share this folder, give it a share

name and click on Permissions. In the groups list, select Everyone and click on Remove. Click on Add, and enter the auditor's username. Now, assign permissions such as Read only or Full Access.

The auditor has to log in using the same username and password, and connect to the shared folder to have access. The auditor's system can run any version of Windows. However, in Windows 2000 or XP, he or she may not be able to use the same username since he or she may have used it to access another shared folder. In that case, go to **My Computer > Tools > Map My Network Drive**. Enter the shared folder address, and click on 'Connect using different username'. Then, enter the username and password created in the system that has the shared folder.

This is just the tip of the iceberg. There are a whole lot of settings you can play around with that will give you total control over your Windows XP PC. You can also use these settings to configure your family PC so that Dad, Mom and your siblings can make use of it amicably.
