

Want to play games? Find out a shortcut? Retrieve a password? Tell the difference between master and slave? Read on...

I want shortcuts

Q I have PIII 1.13 GHz processor with Windows 98 SE and Internet Explorer 6. When I want to type a site name, I have to type 'www.yahoo.com' to open it, but on another PC, I can just type 'yahoo.com' and press [Enter] to open it. What is the solution?

Pradeep Gade

A You don't even need to type site-name.com for sites that begin with 'www.', and end with '.com', like www.yahoo.com; just type 'yahoo' and press [Ctrl] + [Enter]. IE6 will fill up the rest. Depending on the browser you use, there are different shortcuts for Web addresses.

Back home

Q I have a PIII 500 MHz system with 64 MB RAM and a 10 GB hard drive with three partitions, running Windows 98 and Mandrake Linux. I want to change the file system of the Linux partition back to FAT32. When I run Partition Magic, it gives

the message 'disk geometry error'. How do I convert the partition?

Sumit

A Oops! Looks like you botched the partitioning process. Relax, it's possible to make amends using the latest version of Partition Magic, viz., Partition Magic 8 (www.powerquest.com). Alternatively, you can even begin the partitioning process from scratch. Note that since Linux uses the EXT3 type partition to function, you stand to lose all your data when you convert the partition.

Forgot something

Q I have a Pentium III 850 MHz computer with 128 MB SD RAM, 20 GB Seagate hard drive, running Windows 98. When I start Windows, I get an error message that 'A required .DLL file, IMBROWSE.DLL is missing.' Please tell me how to rectify the problem.

Srikanth

A The file probably belongs to an application you have recently uninstalled or re-installed. Start Windows in Safe Mode (Press [F5] when starting), go to **Start > Control Panel > Add/Remove Programs**, and remove all unnecessary programs. If that doesn't work, go to **Start > Run** and type 'regedit'. Press [F3] to bring up the Search box, type 'IMBROWSE.DLL' in the box, and remove

all instances that are found. Restart your computer.

Some play, but some do not

Q I have installed quite a few games such as *Max Payne*, *Need for Speed: Hot Pursuit 2*, *Quake III*, etc. *Quake III* works fine, but when I run *Max Payne*, or *Need for Speed*, my computer restarts and I see the paths 'D:\windows\minidump\mini072303-01.dmp' and 'D:\documents\SPF743~1\sen\local~1\temp\wer6c.tmp.dir00\sysdata.xml' mentioned. D: is the partition I have installed Windows XP on.

I also have a problem playing files that I saved from CDs in Winamp 3. Strangely, I have no problem playing the same files in Winamp 2.8. Please help!

Nabarun Sengupta

A Your computer could be acting up for various reasons. There could be a problem with your drivers, or with DirectX. Since *Quake III* uses OpenGL, it might not face the same problem. Update its drivers for all your hardware, and then upgrade the DirectX version to 9.0b.

This can also happen if you possess a high-end video card, but a weak power supply. If you have such a card, make sure you have a power supply of at least 300 Watts to eliminate this problem. Also, remember to re-install the games after updating your drivers, so as to replace any corrupted files.
