

We suggest you stick with Winamp 2.8, as it is known to be more stable. To enable enqueueing in Winamp 2.8, press **[Ctrl] + [P]** to enter Preferences, move to 'File Types', and check the 'Enqueue as default action' checkbox in the bottom right.

Graphics card for game

Q, I just bought an old Hercules Stingray PCI 128/3D model S3318 card, and would like to know the Web site from where I can download its drivers. Also, do let me know if I can play *Grand Theft Auto 3* using this card.

Sanjana Sinha

A Visit http://us.hercules.com/support/old_driver.php3 to download the drivers for this card. Click on the appropriate operating system to get the drivers. Unfortunately, you will not be able to play *Grand Theft Auto 3*, as the card does not meet the minimum requirements for the game.

Expired, but locked

Q, I have installed a shareware version of Style XP to enhance the look of my XP. Now, the software has expired the trial period, but my XP was not restored to the older condition. The Fast user switching remains disabled, and it prompts for administrator password each time I try to log off, by displaying a message that my computer is locked. What can I do to restore my XP to the original default settings?

Ram Kishore

A In most cases, uninstalling the program should restore your system settings. You'll need to boot into Safe Mode—press **[F8]** at startup and choose 'Safe Mode'. Then go to 'Add/Remove Programs' in the Control Panel. Windows XP offers the 'System Restore' option in Safe Mode. If you haven't turned

Use System Restore to revert to a stable, previous state

Word, Excel and Outlook crash

Q, I have a Pentium III 500 MHz, 256 MB Ram, 20 GB hard disk, nVidia TNT 64 graphics card and run Windows Me. I have also installed Office 2000 Professional and Vcom System Suite along with many other freeware and shareware programs. I have the latest Windows and Office updates. Of late, when I start either Word, Excel or MS Outlook, I get this error message: 'Excel (Word or MS Outlook) has caused an error in MSO9.DLL. Excel (Word or MS Outlook) will now close. If you continue to experience problems try restarting your computer'. When I start either PowerPoint or MS Access, this problem does not occur. I have tried repairing the Office application, but to no avail. I have run the Office SR patches and tried removing the MSO9.DLL file, but still the problem persists. What do I do?

Parin A Jhaveri

A The procedure is pretty simple, just make sure you follow it carefully. For

ILLUSTRATIONS: Farzana Cooper

Windows Me, go to **Start > Search > For Files or Folders**, and type '**mso9.dll**'. In the Look In box, select My Computer, and click Search Now. When the file is found, right-click on it, and select Rename. Change the extension of the file to .old (mso9.dll.old), press **[Enter]**, and close the Find Files window. Go to **Start > Settings > Control Panel > Add/Remove Programs**, and select Microsoft Office. Click on Add/Remove, and in the pop up box, select Repair Office. Now, click 'Repair Errors in my Office 2000 installation', and click Finish.

You could also try un-installing and then reinstalling Office.

the feature off, you'll be able to restore your system to the exact state it was in before you installed the program. Simply select the corresponding restore point.

Misleading information

Q, I recently purchased a Samsung 40 GB hard disk, but it does not get detected in the BIOS. When I refer my motherboard manual, it says that my system chipset is 'Intel 82440ZX PCIset (82443ZX + 82371EB) w/AGP solution' and also mentions 'Dual ultra DMA/33 IDE ports support greater than 8.4 GB HDD'. Why is my 40 GB hard drive not getting detected?

Rahul A Kavthekar

A Your manual only mentions 'greater than 8.4 GB', what it doesn't tell you is that it cannot support hard disks above the 32 GB limit. Your 40 GB hard disk has a jumper setting at the back that says '32 GB clip'. Setting the jumper to this position will let your motherboard detect the hard disk. Remember, enabling this also sets your hard disk to the slave position, so ensure that it doesn't clash with another device on the same channel.

Bad is really bad

Q, Though my computer is only a year old, my hard disk has already developed

bad sectors. I am surprised that computers in cyber cafes are used extensively and do not get such problem, yet my sparingly used hard disk does. What is the main reason for bad sectors in hard disks?

Vijayananth

A Bad sectors are the bane of our existence. They can be caused by a myriad of reasons such as a malfunctioning device, a failing magnetic medium, severe jerks during transportation, etc. Voltage fluctuation and power outages can also result in the head touching the disk surface and causing physical damage. Please do check your mains for any voltage fluctuations, and verify whether you have a 350 Watts of power supply.

I am stuck with 580 x 600

Q, The current resolution of my computer is 580 x 600 with 16 colours. Whenever I change my display settings, it prompts me to restart the computer though I have set it to 'Change settings without restarting'. Even after I restart, I get an error message that says, "There is a problem with your display settings. The adapter type is incorrect, or the current settings do not work with your hardware". How do I fix this?

Gurpreet Singh Kalsi
