

The hard way: Applications usually leave files in Macintosh HD/Library/Application Support and Macintosh HD/Users/[your username]/Library/Application Support. Navigate to these folders, and delete any folders you find that belong to applications you've deleted.

The easy way: Download an uninstaller — AppCleaner, for example — and have it do the dirty work for you.

The bottom line: never assume you're done once you drag an application to the Trash.

 See paths in Finder

While you're browsing your computer using Finder, it's always helpful to see the path of the folder you're in. To enable the Path Bar in Finder, select **View > Show Path Bar**.

The Path Bar will appear at the bottom, and you'll be able to go to any folder in that path by double-clicking on its name.

Take screenshots of whole windows

You can use [Cmd] + [Shift] + [4] to select

of using the mouse to click on them. Unfortunately, OS X doesn't have anything as convenient, but it does have something. To shift focus to the menu bar, press [Control] + [F2]. This highlights the Apple menu, and you can now use the arrows to navigate through all the program's menus.

Fun with Spotlight

Spotlight is quite awesome as is, but there is still much you can do to enhance your experience with it.

 Search system files

One of the biggest improvements in Spotlight for Leopard is that you're not supposed to get irrelevant results — and since very few users ever look for system files, the new Spotlight won't show them in normal searches. But what if you want system files in your results?

Open the Spotlight Window (press [Cmd] + [Alt] + [Space]). On the right, click on the “+” button next to Save to add a search criterion. When the bar

Try not to get overwhelmed by these choices

Hover the mouse over a folder name if you can't see it in its entirety

an area of the screen that you want to capture, but what if you want to capture entire windows, shadows et al?

Press [Cmd] + [Shift] + [4] to bring up the crosshairs that lets you select a part of your screen. Now hit [Space], and the mouse cursor will change to a camera. Now all you have to do is move the camera over the capture, you want to capture, and click.

Shortcuts for Windows powerusers

If you're a keyboard warrior, you've often used [Alt] to get at the menus for Windows programs. Instead

for the criterion appears, click on Kind. This will give you a menu from which you can choose a search parameter. Select Other. You'll now see an embarrass-

Capturing whole windows is easy

ment of choices for you to filter your search. Select System Files; if you're going to be searching for them often, check the box under Include in Menu – this ensures that you don't have to keep coming back to this list.

Now all you have to do is start searching.

If you want to avoid this complex process, however, you could install Google Desktop for the Mac, which indexes system files as well.

 Go to files' locations

Sometimes it just isn't enough that Spotlight lets you open any file or application — what if you didn't want to open a file, but wanted to know where it was?

Instead of hitting [Enter] to open the file, press [Cmd] + [Enter], and a Finder window will open, with your file conveniently selected. That simple. This also works with Google Desktop's Quick Search Bar.

Power searches with hints

If Spotlight isn't giving you the results you desire, you can filter your searches by typing in one of these hints (much like you would with a Google search):

`kind:[filetype]` search term — searches within files of type filetype. For example, “`kind:music`” (without quotes) searches all files that OS X sees as music — MP3, AAC and so on.

`comment:text` — searches for files that have text in their Spotlight comments

date:date — searches for files created on date. You can also use “this month”, “today”, “this week” and so on (without the quotes)

pages:n — searches for documents with n pages

layer:text - searches for Photoshop files with layers whose names have text in them

Unfortunately, Apple hasn't documented these hints, but there's hope.
