a 3D experience. It will also come with a software which will allow it to display videos, images, and games in 3D. The notebook is HDTV ready and comes with a connector that will allow it to be used with an external screen – although you will most certainly lose the 3D functionality in this case. The notebook will also come with 4 GB memory, and an option of either a dual-core Pentium, or a Core 2 Duo processor. The netbooks will start at a price of Rs. 43,000 for the Aspire 5738DzG.

The new X1261 projector showcases “2500 ANSI Lumens brightness, a contrast ratio of upto 3700:1 a native XGA resolution & a lamp life of upto 4000 hours.” It is capable of displaying 3D images by projecting both right-eye and left-eye images which can then be viewed using an appropriate 3D glasses to get a 3D effect.

Google upgrades search with real-time and mobile features

It was bound to happen, but is quite exciting nonetheless. Google Search has now added support for real-time search results.

Now when you search for any topic, you will see a search section that is constantly being updated with new results. The real-time search section shows results from sources such as blogs, news, Twitter and FriendFeed. They've also revealed their partnership with Facebook, MySpace, Jaiku, and Identi.ca other than FriendFeed and Twitter for realtime search.

So searching for a trending topic such as “GM” is sure to give you a feed of people mentioning it in Twitter or on their blogs. By showing only the latest search results you get a full page with just a stream of real-time updates.

With this, they are also graduating Google Trends from Labs after adding a new “Hot Topics” feature that shows some of the trending topics on Google search.

For mobile devices, Google is redefining the way searches are conducted by utilising additional data available with such devices. On mobiles, besides just a text query, more data can be utilised to get a more context sensitive and accurate search result.

On mobile devices, Google Search can now conduct voice search in Japanese. Google Maps has also added a feature that can take

into account your location and perform a search of “what's nearby”.

One of the most exciting new search features would have to be Google Goggles, a new feature for mobiles that lets you search using images instead of text. With Google Goggles, you merely point your camera to the object in question, whether it be a book, a monument, an artwork or logo and Google will look it up for you. With this new feature, you can simply point your camera at a landmark and click a picture and find out its name, and other search results.

Google can also keep a “visual search history” similar to web history feature that lets you see all the images you've searched before.

Intel reveals information about future Atom chips

Intel's next range of Atom chipsets seem to be ready to take NVIDIA Ion head on. The new lineup will be smaller, faster, will reduce the average power consumption by as much as 20 per cent, and are expected to be available as early as January 2010. However, the best feature of these chips is the integration of a GPU.

The three new processors will all come at 1.66 GHz and will come with an integrated Intel NM10 Express graphics chipset. With the integration of the CPU, GPU and memory controller on one chip, the outcome is a reduction of size by 60 per cent for a netbook footprint and up to 70 per cent for a desktop.

Of the three new processors, the N450, D410 and the D510, the N450 is intended for netbooks, while the D410 and D510 are

For a more detailed report, camp at <http://www.thinkdigit.com/d/mw2>

intended for low-end desktops, (nettops / HTPCs). The N450 comes with a 512 kb L2 cache and a total TDP of 7 W, increasing the battery life on netbooks.

The D410 has the same 512kb L2 cache size as the N450, at a total TDP of 12 W. The D510 is a dual core Atom processor with features a 1 MB L2 cache and a TDP of 15 W.

By providing a more integrated solution than NVIDIA's Ion Platform – which offers NVIDIA's mobile graphics chipsets with the Intel Atom processor, it's clear NVIDIA has some tough competition ahead. **d**
