

Zoomin has a new look

The photo printing web site that won our web award in September, has a new look. Stay tuned for our full review at thinkdigit.com

Nerrot.com

If your bored looking through a page full of a hundred torrent listings try this web site. It's the equivalent of Google's "I'm feeling lucky" option for torrents

the GPU could be used to fire up your browsing. We'll have to wait and watch.

Google goes real time

After staying out of the real time search domain for a long time Google has finally entered the fray.

Now when you search for topics you will see a section of search which is constantly being updated with new results. The realtime search section shows results from realtime sources such as blogs, news, Twitter and FriendFeed. Google have partnered with Facebook, MySpace, Jaiku, and Identi.ca other than FriendFeed and Twitter for realtime search. The partnership with Facebook means that information from Facebook pages, or any other public listing such as events, will also soon be available to Google.

We ran a few searches to test this upgrade and it seems

like only a few search terms get the real time updates. These search terms are only the ones currently in the 'hot topics' section of Google Trends (found under More Services). Clicking on "Latest results" brings up a full page consisting of real time results.

Google is not the first one in this space. Bing had beat Google to the punch by launching this service before them. Prior to the biggies entering realtime search, if wanted to know what's happening on the internet at any point in time, you had to head over to icerocket.com to search for blogs and blog trends. Another one is collecta.com; this displays your search results as a continuous flow that gets refreshed every few seconds. oneriot.com or scooper.com too are great sources for the latest trending topics in the web 2.0 world from sources such as twitter. com. These web sites neatly

Privacy settings in Facebook

sort topics into categories like business, technology and music etc. Why would one use google or bing anyway? Well perhaps when this gets built into all search terms and not just "hot topics" from google trends, this will prove to be useful to even the regular researcher to get an idea of the mood of the people around the world regarding the topic in question.

I wantz.it

Now here's a service that lets you broadcast what you want to the whole world. Wantz.it is a free web application that lets you create lists of what you want and then share them with friends via Facebook, Twitter, email and blogs.

One of the better things about this wish list service is that you can add anything on the web to it. Just enter the URL and it gets added to your wishlist. From twitter and delicious just put @dowant. Wantz.it is a way to make sure that your friends know what you have your eye on. If you choose to link your Facebook account, the items you add on the list appear on your friends' feeds too. Our suggestion couldn't have come at a better time too – your friends and family won't have to scramble around guessing what you'd like for New Years! So go ahead and put the HD 5970 on your wishlist. If you've been good all year,

maybe Santa will steal a piece for you.

Facebook: Privacy?

Almost everyone from your grandma to your local milk shop guy is using Facebook these days and worse – adding you! With family and random people getting hooked to the ever popular social networking site, it has become increasingly essential that you know how to keep certain parts of your profile concealed from certain people. You might recall the famous case of a woman who got sacked from her job because someone put up pictures of her at a party on a day that she was supposed to be sick at home. The way to control what you share, is through privacy settings in your account. This month Facebook made long overdue changes to it's privacy settings. We say "long overdue" because a lot of users wanted the privacy settings to be simpler.

Instead of focusing on usability, Facebook has tried to nudge users towards opening up their accounts. This brings up the eternal debate – whether to be open or not on social networking sites. The argument is if you're there to network, why not share more content with people? Either way, Facebook's changes brought them complaints from several privacy groups in the US. They say the default options after the Privacy settings revamp, point towards sharing stuff with everyone, and not with 'only friends' as was the case earlier. **d**

Google search results now include real-time tweets
