Fennec coming

Fennec, Mozilla's Firefox browser for the Nokia N900 device is very close to release

Pocket Technologies>>

Touchscreens will go a long way on portable devices, as the technology is getting increasingly cheaper. The keypad might be replaced even on lower-end candybars, and the back surface of the device is an untapped area for further interfacing. This will allow for versatile devices for a wide spectrum of activities, from gaming to communication. Modularity may be another trend, with gaming pads or high quality video recorder plug-ins available for your hardware. The processing power will soon reach that of desktops in the beginning of the millenium, and being online won't be a problem at all. If all you want is a functional mobile phone, you may get it as a ring, an earpiece, a bracelet, or even a disposable one where the sim, circuitry, and buttons are all printed on in vending machines.

Fast Forward>>

We look at current concepts and prototypes peek at which devices we will be drooling over in the not too distant future

Wearable Technologies>>

Bluetooth and Wi-Fi T-Shirts and Caps are passe, we'll soon be putting on much more than clothes. Embedded within the fabric or as strap-on gadgets are a wide range of input and output devices. A lot of these will easy plug in to existing systems. The utilities range from easy to use cameras, wafer thin, glove-like cell phones, keyboards that are wired to your fingers and searching for information on the go. Consumer exoskeletons to boost the physical strength and agility of the body are under massive development, with military and industrial applications as well. Augmented reality devices, like MIT's Sixth Sense showcased here will be a major landmark, as this will blur the lines between the digital world and the real world. All of this is without the gadgets getting beneath our skins.
