Philips' 42PFL5609 initially comes across as the 42PFL7409's poorest pal. Part of the 5 series, the build quality is okayish, with the plastics being lower grade than its higher-end sibling. The panel also appears to

be suitably scaled down, and this is not to nitpick, because the display isn't bad – it's just we had the 42PFL7409 at hand, and the difference, is very noticeable. The native resolution for PC is set at 1360 x 768 pixels, while the display itself goes up to 1080p.

Using DisplayMate, the contrast ratio is immediately noticed to be deficient. This shows up in movies, especially darker scenes. Input lag is not noticeable. There is also a tendency to over saturate reds. Picture quality is good, but there was some minor banding noticeable and the display does not work with non-native resolutions as well. On the whole, movies are fun, especially higher resolution stuff.

Gaming is a little less involving, owing to the deficient contrast. Use on a PC should be avoided as text crispness and overall display clarity is a problem, unless you're willing to run it at 1360 x 768 pixels. At Rs. 64,990, it's pretty overpriced, but better than the Samsung 40-inch LED display in terms of value.

Skullcandy Skullcrushers Black Checker

Blows the mind... literally

The Skullcrushers Black Checker model is undoubtedly one of the boldest looking headphones we've seen. The design might be attractive to some, but those who want simple yet elegant looking headphones will hate this. Although the build quality isn't great, there's a lot of flexibility to fit your head. Those with really big heads might find it uncomfortable as well.

The key feature is the bass on this thing. To power

this overly powerful-for-a-headphone speaker, an AA battery is required. The battery holder block also has bass-level control. The bass is excessive and is so much that you can feel your ears and the headphone vibrate. We used it at 10 per cent overall capacity.

Audio quality isn't great – the bass is overkill. It kicks into the music at the wrong time all the time. Without any bass, the quality is decent. For games

and action movies, the bass can be fun.

These cans are crude and they're like a toy. But they are loads of fun with all the crazy vibrations in games or movies.

Specifications

30mm neodymium magnetic speakers, Frequency range: 20 – 20 kHz, 1.5-m cord
