# Compro VideoMate IP50W

Your neighbourhood watch

The Compro VideoMate IP50W is a security camera system that uses a network camera to remotely monitor areas of your office or home. The camera has a good sturdy design, but it has a steady flashing blue light at the front that draws attention.

The installation is supposed to be pretty straightforward, but we had some issues with automatically detecting the network camera on the network using the software provided.

The camera and the software together has several features. The software and web interface on the camera allows resolution and frame rate settings to be managed. The ComproView software has

support for multiple cameras and the system allows for motion detection and recording as well.

You can access the camera over the web on desktops as well as mobiles. In that aspect, it's extremely versatile. There's even Wi-Fi and two-way audio streams.

All the features work flawlessly and the remote access to the camera over the net is good. The Compro VideoMate IP50W is a great security solution. If it doesn't grab pictures of intruders, just knowing that it's present is sure to keep them away. A built-in battery would have been a nice thing to have in case of power outages. The

market price of Rs. 7,000 (MRP is Rs. 10,000) is a little high if you think of it as a gadget, but not when you think of it as a serious security camera.

## Specifications

1/4-inch colour CMOS VGA sensor, resolution: 640x480, maximum frame rate: 30 fps, **Dimensions:** 84 x 124 x 91.5 mm

# Autodesk Maya ECS 2010

Be your own 3D CG studio

The concept of suites is somewhat new. We look at the Maya Entertainment

Suite 2010, which is a bundle of Maya 2010, Motionbuilder and Mudbox.

This suite is huge and has tons of possibilities. Maya is best known as a 3D modelling tool and is compared to 3D Studio Max. Some key improvements have been made to include better stereographic camera support for 3D movies. The interface hasn't changed a lot and modelling is still most comfortable for those well versed with it.

Motionbuilder allows for intensive character rigging and animating features once the model is complete. The user interface is very simple because of the use of colour and easy-to-understand controls for the rig itself. Tweaking of physics and animations in real-time is also very well done.

With close integration in Maya, Motionbuilder and Mudbox, it's easy to move models and scenes from one package to another seamlessly. The new avatar of this package from Autodesk allows independent artists and studios to be able to have a complete 3D content development suite that integrates and therefore works well as a package.

## Requirements

Windows XP/Vista 32 and 64-bit versions, 2 GB RAM, 5 GB disk space, 512 MB OpenGL / DirectX 9.0c card,
