ZOTAC GeForce GT220

A cool entry level graphics card, literally

ZOTAC GeForce GT 220 is an entry-level graphics card that provides quite a punch with its limited features. Armed with a 625-MHz core clock and a memory clock of 1580 MHz, the GT220 has a 1-GB DDR3 memory.

It comes with an HDMI port which makes it deal as an HTPC graphics solution. It does not need any additional power.

The card was tested on our graphics card test bench – an ASUS P6T Deluxe motherboard on a Core i7 975 processor. For an entry-level graphics card, the GT220 performs well. It was better off than the ZOTAC GeForce 9500GT.

Get the full benchmark scores at www.thinkdigit.com/d/1001_zot220

The GT220's advantage is that it does not tend to heat up a lot. We only saw a 4 to 5 degree difference between load and idle temperatures.

Priced at Rs. 5,500, the GT220 is slightly expensive,

considering that XFX GeForce 9600GSO, one of the winners in our entry-level graphics card test is marginally better and is also available at a lower price. If you're planning to buy a new card, it's better to wait a while.

Specifications

GPU Clock: 625 MHz
Memory Clock: 1580 MHz
Memory Interface: 128-bit
Video Memory: 1 GB DDR3
Dimensions: 365 x 156 x 22 mm

Corsair HX850W

Large, lovely but overkill

The HX 850W comes snugged inside loads of styrofoam and a huge package. The PSU is well constructed and heavy and the finish is a matte powered coating that seems rugged. Being modular, cable clutter is minimal since

you only use the cables you need. The cables themselves are sleeved in a nylon jacket and pretty long, certainly enough for larger chassis or bottom-mounted configurations. A 140-mm fan handles air circulation and this fan is touted to be ultra quiet till the load on the PSU crosses 70 per cent.

Try as we could, we couldn't load the HX 850W to anywhere near its maximum potential. Even with a Core i7 975 Extreme, 6 GB of DDR3 memory, 2 x

Western Digital Velociraptors and 2 x ATi Radeon HD 5870 graphics cards, everything was rock steady. Needless to say, there were no hiccups whatsoever. It has an unheard of six PCIe power connects and each of these are 8-pin connects, meaning this PSU is totally future proof. We feel running two Radeon HD 5970 cards should also be possible.

For most people, this is a gross overkill. Still, it's remarkably well built and remarkably efficient and it's built from premium spec components. To top it all, it has an unbeatable seven-year warranty.

Specifications

Power – 850 W, connects – 12 x SATA, 12 x 4-pin molex, 6 x PCIe, active PFC, single rail 12 V design
