Fyoocher DDR2 2 GB

A new comer that we'll remember

Fyoocher is a new player in the entry level memory market and have launched a range of memory modules for laptops and desktops. We're looking at their DDR2 desktop memory.

This value memory is pretty much like any other value memory – no heatsinks or fancy coolers on it. We ran the tests with the memory forced to run at its speed of 667 MHz. Timings were set to 4-4-4-12 and we faced no sta-

bility issues whatsoever.

The memory was tested on a X38 chipset board running an Intel Core 2 Duo Q9650 processor. It performed quite well in the benchmark tests. The RAM

gave a memory bandwidth of 4.42GBps in SiSoft Sandra which was similar to the Corsair Dominators 2 GB DDR2 RAM kit running at the same speed and timings.

The RAM memory is best suited for everyone building PCs within limited budgets. Gamers who want to overclock might not be pleased with the overclocking performance of this memory.

At Rs. 2,500 (MRP), it's a good VFM buy. Market prices are bound to fluctuate.

Specifications

Memory: 2 GB DDR2

Speed: 667 MHz

GlacialTech X-Wing R1

Generously large cooler, but a tiny fan

The X-Wing R1 is one of the few decent looking notebook coolers around. Some might find the bright red accents loud, but we feel it complements the black body. It's well built and the top is entirely mesh with a rather small fan enclosed. The centre of the rear is vented. Two pegs are provided for further inclination towards your body, if the need should arise. Even without these, the cooler is pretty high and the palm rest on your notebook is at least 1.2-inches higher than normal. Towards the end of the notebook, the height is only slightly more at 1.8-inches, using the foot-pegs raises this by another 0.5 inches. The cooler has a rubber strip running across the mesh and this is better than the traditional pegs used, since it will prevent both big and small notebooks from sliding.

Up to 17-inch notebooks can fit on this cooler.

The wrist support has a quite a few blue-LED backlit buttons, for varying fan speed, displaying the temperature and fan RPM via an integrated two digit, monochrome LCD. There are also multimedia buttons along with volume controls. Thankfully your wrist will not accidentally activate anything, because you have to apply extra pressure to engage the buttons. The fan is a low RPM

one, and has a pretty low CFM thanks to its size, meaning the speed control doesn't do much, we'd prefer a larger fan that covered a greater surface. While this won't cool down notebooks with heavy-duty GPUs, it does okay with regular notebooks that have venting on the rear. While it affected the temperature of an Acer notebook we tested, it had no effect on Apple's MacBook Pro. A niche product, and a mediocre one at that, in terms of cooling.

Specifications

Fan size: 70 mm, body – plastic with metal mesh

Speed: 667 MHz
