❓ C/C++ coding on 64-bit Windows 7

I have a Sony VAIO VPC-CW15FG laptop with Windows 7. I use a 64-bit operating system on it. I want to code in C and C++ and need help with a better programming software. I have Turbo C++ 3.0 which doesn't work any more with this version of Windows. I need some software that is compatible with Windows 7.

Tousif Bandaly

You can try running Turbo C/C++ using compatibility mode in Windows 7. You can also try using the virtual PC

❓ More Memory?

My PC has 2 GB of memory, which is under utilised. It always uses virtual memory on the drive instead of the RAM. My RAM usage is usually less than 1 GB and the hard drive page file is always above 1500 MB. Why is the available memory of RAM underutilised? Whenever I launch any application, only the page file consumption usage increases and not the RAM usage. I want to know this is because my hard drive is very slow. Because of the virtual memory file, everything takes time to load and I don't get the performance that

Graphics card, 1 TB Seagate HDD running Windows Vista Ultimate.

I often browse Youtube and other video sites. I leave around ten videos to buffer fully before I watch them. Every time I click the play button, it takes a long time to load from my drive and my video playback performance suffers. Sometimes, the video plays

without the sound. This really annoys me! I have to close all the application and reopen it again for it to work again.

Why does my system not utilise the entire memory? Will a memory upgrade to 4 GB reduce the virtual memory usage? Is it recommended for a user like me? I have tried Ready boost and USB VM options, but the result is even poorer performance. The worst part is that I updated to Vista SP2 last week and the performance got worse.

Can you please help me out with all these issues. I tried different things to resolve this problem, but I haven't found any solution. It will be helpful

Disabling virtual memory entirely on Windows

Turbo C++ running within the DOSbox emulator

feature on Windows 7. Also, try using DOSBox (www.dosbox.com), a free DOS emulator.

If you want a program that runs on Windows 7, try Dev-C++ (www.bloodshed.net) and Eclipse (www.eclipse.org).

I should get with this kind of system configuration.

My system configuration: Intel Core 2 Duo E7400, Intel DP45SG motherboard, Transcend 2 GB DDR3 1333 MHz RAM, XFX GeForce 9500GT

if you could write an article in your future issues regarding RAM, virtual memory explaining all the terms shown in the task manager.

Karthik R

If you want your memory to be used better, you can disable the paging file completely. Press [Windows] + [Pause]. Go to Advanced system settings, Performance, Advanced. Set it to Use no page file. You'll have to reboot after this.

If you're trying to buffer ten Youtube videos at once, it might still slow down a bit. Flash can be pretty menacing and use a lot memory. Upgrading to 4 GB won't make things a lot better.
