

Inside IBM

We find out what's cooking at IBM from Dr. Ponani Gopalakrishnan, VP, India Software Labs

NVIDIA on Tegra

A talk with Jen-Hsun Huan, Co-Founder, NVIDIA on Tegra and other technologies

☒ The December issue was great. When compared to last year, its up several notches in value. Digit is the most promising technology magazine around. Content, presentation and reach – there's hardly any other tech mag in India that matches up on these fronts.

The print was near perfect and did away with all my previous gripes. So did the overall coherency and layout of articles, it was sweetly on time at the stands and DVD contents were well organised, kudos to the team!

Your TED coverage was a revelation, it's good to know that innovations and ideas do get the spotlight in these days of commercial gimmicks and sales pitches. Eagerly awaiting its video coverage.

Zero 1 awards were convincing, although the all-Apple PMP ensemble and all-AOC monitors were quite fiddling (Cowon S9, Sansa Fuze, Clip+ and monitors from Dell and Benq should've deserved a mention).

'Enterprising ideas' was really inspiring and I encourage more such topics.

Digital media distribution in India is plagued with unjustified revenue schemes and poor delivery infrastructure. But it's good to see reliable movie rental services are now available and affordable. Though an Indian iTunes is still way down the line, such initiatives towards simplified media availability is always welcome. Interesting to note the caption at the start of the article stating "converting and storing rented movies is illegal". Though one wonders how the legality here is enforced or even ensured? Since the copy protection encryption (CSS) these movie disc employs can be easily bypassed (unlike the types of SecuROM in games) and thus sails the pirates! To find the balance between effective revenue generation and non-restricting rights protection policy, a reboot of existing irksome DRM formats is really needed.

Something for Agent 001 – is any 'hardware encrypted' portable hard disk available in India? If possible, do include such drives in your shootout in January.

I think a 'proper' *Fast Track to Photoshop* is due, despite earlier attempts such as

Imaging and Photography which were just the basics. *Visual Studio* and *Web Designing* can also be detailed in future editions.

Lastly, I miss the old 'ESC' as I find the new one a bit hokey!

Keep up the good work guys. Have a great new year!

Bhupati Baboo

d Hardware encrypted drives are difficult to find in India, especially in the portable storage market. Seagate, for example, has hardware encryption on some of their enterprise desktop and laptop drives. It would be difficult to do a comparison test of a niche product category, but we can surely do standalone reviews of such products.

We've been receiving requests for *Fast Track to Photoshop CS4* for quite some time now. We'll keep that in mind. We've tried to add a little more to our *Escape* section this issue. Hope you find it interesting.

Rossi

☒ I am a 15 year old reader who is fascinated by your tech magazine. I have no words to thank you. You guys have done a great job. I have been reading Digit for over two years now. I've read many tech magazines, but Digit is the best one. I've heard Windows 7 has great features, performance and security. I wanted to try it out. I tried to download the beta version, but it takes a long while. Please provide it

in the January issue. Also, include a free internet speed booster as I'm experiencing low internet speeds. I'm keen to know about the top 5 desktops, laptops, LCD monitors and pen drives in terms of performance and features.

Siddharth Shankar

d Thanks for writing in. You can try out Windows 7, which is included in this month's DVD. Free Download Manager is a great way of experiencing downloads at high speeds on your connection. You'll find this on this month's Mindware DVD the Essentials section. Keep reading these pages for informative comparison tests. We have printers and storage solutions in this month.

Aditya

☒ I'm planning to buy a new LCD for my dual-monitor HTPC (22-inch/24-inch for work and 32-inch for movies and racing). I don't want a TN panel. I want good contrast ratio, so probably MVA should be my choice. But I'm confused and so I referred to the LCD test in the August issue of Digit. Surprisingly, all I can see is TN panels in the review. Only one astronomically priced MVA and IPS panel was in the 22 inch and 24 inch category. Dell has a 22 inch eIPS for around Rs. 20,000. Other brands should also have a few models around that price mark. Please don't forget us
