

Office 2010

Before we could recover from the surprises packed into Windows 7, Microsoft released the Office 2010 Beta version. Full of new and convenient functions, the new Office can be downloaded for free at <http://www.microsoft.com/office/2010/en/default.aspx> with the foreknowledge, of course, that it's only going to work till October 31, 2010.

Word screenshots

No more using [Prt Scr]. You can now take a screenshot from within Word. This is great for writers who need to add images between their text documents.

If you want to take a screenshot, click on the **Insert** tab in the now familiar ribbon above, and you'll notice a button that says **Screenshot**. Run the mouse over it and you'll see a drop down window that tells you how to use it.

If you click on the screenshot button, it'll give you a preview of all the windows already open on your computer. It will not show you the windows you've minimised to the taskbar, so make sure they're all active behind the window you're working on.

Click on the one you need and it'll be inserted into the page you're working on in Word.

Office 2010	1
Konfabulator	2
Thunderbird 3	3
Ubuntu 9.10	6
Power saving tips	8

Please note this feature will not be available if you're working on Word in Compatibility Mode, but you'll still see the **Screenshot** button in the ribbon when you click on the **Insert** tab. To activate it, you'll need to click on **File > Info > Convert** so that the document gets out of the 1997-2003 format and lets you make use of the new features.

You probably noticed the **Screen Clipping** button at the bottom of the window that drops down from the **Screenshot** button. This allows you to crop or clip any part of a

screen image and instantly include it into your Word document. Click on the **Screen Clipping** button and your docu-

ment window minimises itself to show you the next open window behind it.

Remember to close all other Windows except for the one you need to take the image from since this function only takes the one directly next to the one you're working on. This screen then takes on a white pallor and the cursor turns into a + sign. Click and drag the mouse over the portion of the image you wish to capture. Once you're done, the window automatically disappears to reveal your selection on the page of your document.

You could do the same with OneNote (Insert > Screenshot) and PowerPoint (Insert > Screenshot).

Blogging with Word

Fed up of copying/pasting or uploading into your blog? Word

Don't minimise the screen you want captured

You can use this to insert full screenshots into text documents

The screenshot adjusts to the parameters of the page
