

Convert to get the best out of Office 2010

2010 allows you to post your literary outpourings straight from your document, without having to go through the process of opening a browser, logging in and uploading.

Just click on the Office button on the top left above the ribbon (File). Click on the New tab and choose the Blog post button. Click on the Create button on the right. You need to register your blog. You can choose from the most popular ones such as WordPress and TypePad.

All you have to do then, is fill the User ID and password for your blog. Once you're done with your blog post, simply click on the Publish button on the top left of the ribbon.

Video in PowerPoint

Until now, if you wanted to show your audience a relevant or interesting video, you had to create hyperlinks on your PowerPoint slides and temporarily *move out* of your presentation for the purpose.

PowerPoint 2010 lets you insert videos (or audio files, as the case may be) directly into the presentation itself.

When you wish to put a video into a slide, just click on the Insert tab above the ribbon on top of the page. Click on Video on the right side of the Insert ribbon and the drop-down menu asks whether you wish to embed the video from your own PC or from a web site.

If you click on Video from file..., a browse dialogue box appears for you to locate the file. Once you select the file, PowerPoint will embed it into your presentation.

You can even insert videos directly from YouTube, Daily Motion or any of your favourite video sharing site. When you click on Video from web site, simply paste the embed code directly into the text box that appears and the video is

Video embedding made easy

Add images to your notes

visible in the middle of your slide. You can then change the size of the video using the variety of Video Tools that appear in the ribbon above. With the same procedure, you can embed audio files directly into your presentation, using

the Audio button next to Video, on the Insert ribbon.

Konfabulator Getting started

To use Yahoo! Widgets on either your PC or Mac, you first need to grab the installer online (widgets.yahoo.com) and install it. Download the program, install it and go through the initial few options.

Photo streaming

The photo viewer that comes built-in with Yahoo! Widgets is actually the best tool when it comes to browsing pictures stored on your hard disk. When you first click on it, you will be asked to choose between loading pictures from Flickr, Yahoo! Photos or your PC.

Choose My Computer, right-click on the little pane and click on widget preferences. A small window will open where you can customise the settings for your pictures. You can choose the folder to monitor for photos in the Select Picture Folder. By default, it is set to My Picture. You can set the images to randomly or chronologically appear through the Sort Pictures option. You can set a transition interval of every minute, five minutes, 15 minutes, half hour or hourly. The second tab of the settings, Frame, will let you choose the style of the frame and the maximum size to display any picture. It's a cool way to keep looking at all the photos you have on your hard disk without having to browse through them manually.

If you store your pictures on Flickr, these settings can be used to configure default Yahoo! Widgets photo application for the photo-sharing service as well. To browse through pictures in online photo albums, WebImages (<http://widgets.yahoo.com/widgets/webimages>) offers better customisation and lets you save those web images on your hard drive.

To check out cool photos of the day from Flickr or National Geographic, there are two great tools. For Flickr, check out Flickr Explor'r (<http://widgets.yahoo.com/widgets/flickr-explor39r>) that show-
