

Google Calendar

Mozilla developer Bryan Clark has come up with an awesome extension that allows users to use Google Calendar in a separate tab in Thunderbird 3.

To get Google Calendar running as a separate tab in your TB3, head over to Clark's blog (<http://clarkbw.net/blog>) and scroll down to the entry on running Google Calendar in Thunderbird Tabs (November 23). Clark has provided a link to download his extension in XPI format. Once you save the file to your hard drive, open up Thunderbird and go to Tools > Add-ons. Navigate to the Extensions tab and click the Install button at the bottom-

> Google Calendar tab. Clicking on it will open a new tab prompting you to sign into your Google Calendar. Do so and you are ready to start using Google Calendar from a tab within your Thunderbird 3!

Google Wave

The new Google Wave service has been getting a lot of media attention, especially with its invitation-only policy. However, while it is touted as "what email would have been like were it to be invented today", Wave is not compatible with Thunderbird 3 or any other email client.

Thankfully, the web is full of clever little hackers who are

```
tor;1'].getService(Components.interfaces.nsiWindowMediator).getMostRecentWindow("mail:3pane").document.getElementById("tabmail").openTab("contentTab",{contentPage: "https://wave.google.com/wave/?nouacheck"});
```

Click Evaluate and Thunderbird will open up a new tab with Google Wave running in it. Sign in and start waving! Cool, eh?

Browse links

One of the biggest complaints people have with email clients (and so do we, to be frank) is that when you get a link in an

you don't have to switch the browser window at any time and every link just pops up in an adjoining tab.

But that's where Thunderbird differs. Thanks to its large open-source community, the program has an extension called ThunderBrowse that lets you browse through sites and links right from inside your email client.

You can grab the extension from the add-ons manager or download it to your PC from thunderbrowse.com and install it. Once installed, ThunderBrowse will give you lots of options such as using autocomplete, enabling Javascript and cookies. The add-on is highly customisable and you can go through the options to tweak it to your favoured settings.

Running web apps

The method used to run Google Wave was inspired by Bryan Clark's source code for the Google Calendar Tab. Clark has also listed another cool work around for users to run any web app they want - be it Twitter, Facebook or Orkut - from a tab in TB3.

First, you go to Tools > Error Console in TB. In the box, type the following code: `Components.classes['@mozilla.org/appshell/window-mediator;1'].getService(Components.interfaces.nsiWindowMediator).getMostRecentWindow('mail:3pane').document.getElementById('tabmail').openTab('contentTab',{contentPage: 'http://ABCDEF.GH.COM'})`

To browse to a web app of your choice, simply replace the ABCDEF.GH.COM to the site address such as Twitter.com or Facebook.com. Once you hit Evaluate, you should get

You can now use Google Calendar from within your Thunderbird client

left corner. In the pop-up box that follows, browse to where you have saved GoogleCalendarTab.XPI and open it to install the same in your TB.

After restarting your Thunderbird, head to Tools

ready with a way to run Google Wave in your Thunderbird 3. First, go to Tools > Error Console. There, in the provided box, type the following code `Components.classes['@mozilla.org/appshell/windowmedia`

email, you invariably have to go to a different application - your browser - to open it. This is annoying, tedious and one of the main reasons so many people prefer to use an online email client like Gmail, since
