Movies anywhere, any format

UltraViolet is the open standard system which lets you watch movies you buy regardless of place or format being tested by media companies

viruses nor have I had to use any anti-virus software on Linux. However the software does exist and it is not going to die, but it is going to evolve, especially for Linux systems.

Yuval Ben-Itzhak

Senior VP Engineering, AVG Technologies

The term Antivirus is still interpreted by many people as a software that tries to match known signatures of virus/malware with a given file. In simple words, traditional signature based anti-virus tries to identify a virus based on what it looks like. This was true until 8 years ago. The new

technologies are no longer using signatures but detect a malware by its behavior (in simple words, by what it does rather than by how it looks like).

To summarize, today's security products such as AVG are actually security suites and not just traditional anti-virus as many people still consider them. So the days of antivirus are not over at all, there are just additional security layer that were introduced to provide the needed protection.

David Hall

Regional Consumer Product Marketing Manager, Symantec, Asia Pacific

Malicious activity is more rampant than ever. In 2009, Symantec identified more than 240 million distinct new malicious

programs, a 100 percent increase over 2008.

The growing sophistication of malware means online threats are no longer limited to viruses, but also include spyware, spam and phishing, among others. The industry is therefore quickly realizing that traditional approaches to antivirus, both file signatures and heuristic/behavioral capabilities, are not enough to protect against today's threats. We have reached an inflection point where new malicious programs are actually being created at a higher rate than good programs. As such, we have also reached a point where it no longer makes sense to focus solely on analyzing malware. Instead, approaches to security that look to ways to include all software files, such as reputation-based security will become key.

As Indians increasingly go online to work, play and stay in touch, they need more protection, not less. Consumers need to invest in a comprehensive and up-to-date paid security software featuring reputation-based technology, and that is the direction in which the security industry is heading too." 

SentinelHASP™ STOP PIRACY & ILLEGAL DISTRIBUTION OF YOUR SOFTWARE

Are You Losing Your Revenue And Potential Customer Due To Piracy Of Your Software?

Sentinel HASP SRM Industry's First Fully-Integrated Hardware and Software-based Software Rights Management Solution

- Strong Copy Protection to combat software piracy
- Secure & Flexible software licensing and software License management
- Unmatched IP Protection to maintain your competitive edge
- Enforcement through Cross-Locking™ Technology that enables choosing either hardware-based (dongle) or software-based (product activation)
- Role-based to Fully Align with the Product Lifecycle
- Easy to use license management tools
