A look at the ten most promising iPad competitors

Terrafugia

Wish you could travel the Jetsons way? Well the dream of owning a car that flies can soon be a reality by this year end. A group of MIT alumni have designed and demonstrated a wing design that can fold inside, making the whole flying car concept more practical for normal use. The design was tested over 500 times on the Terrafugia and has been functioning fine. Let's hope this wonder car takes off soon! Get your's for just \$194,000.

World's smallest Phone

With a size smaller than your average cell-phone battery or a credit card, the Modu 1 will surely attract loads of eyeballs from everywhere, as it's so damn small in size. Recently launched in the UK, the name Modu comes from the customisable modular jackets the phone can fit into. Based in Israel, the Modu will soon have its next installment available - the Modu 2 which will have a touchbased interface.

Intel's new 'remote' technology

Researchers at Intel have churned out a proposal for a remote control which shows tailor made content on your TV the moment it comes in contact with your hand. Working on the motion sensor platform the remote takes accelerometer readings every 100 nanoseconds and builds a database about your choice and selections on the TV so the next time you handle the remote the TV will start showing you content which you like. However the accuracy level is still between 60-90 percent, not bad for starters.
