

A network drive with hiccups, a short-sighted screen, upgrade troubles, lame Autoruns and sick CPUs... queue up now to get it all fixed

Yahoo! It's up again

I recently installed Windows XP on my PC. The configuration is Celeron 733 MHz, 128 MB RAM and an 8 GB hard disk. Whenever I try to access the site <http://groups.yahoo.com> I get the following error:
"Gateway Timeout
The following error occurred:
A gateway timeout occurred. The server is unreachable.
Retry the request.
(GATEWAY_TIMEOUT)
Please contact the administrator."
All other Web sites open fine.
What do I do?

Avinash

Don't worry. This happened because the government of India banned the Web site for a short while.

Click the Groups link on the Yahoo! Groups page

You should be able to access the site now. If you still face problems, go to www.yahoo.com, click on Mail, and log in with your username and password. Now click on the Yahoo! link on the top right, and when the page loads, click on the Groups link.

Where's the SFC?

I have a Pentium III with a 20 GB hard disk, an 810e motherboard, 128 MB RAM and a Savage display card. I recently installed Windows 2000, and tried to run SFC (System File Check-

er), but it didn't start. Is there any way to open SFC in Windows 2000 professional?
Amish Mehta

Don't be alarmed. The fact is, Windows 2000 only has a DOS-based SFC. To start it, go to the command prompt, type 'sfc' and press [Enter]. Here, you'll find some help on how to use sfc.exe, and the syntax to use.

Moody network drive

I run Windows 2000, and whenever I start Adobe Photoshop, I am unable to access a Mapped Network drive; it gives the following error message: "Insufficient quota to complete the requested service." If I close Photoshop, I can access the drives again. Only rarely can I access network drives while using Photoshop.

Shiva Pillai

This problem is caused by either a corrupt TCP/IP protocol, or a memory leak problem. Firstly, try to re-install the TCP/IP protocol—go to **Start > Settings > Control Panel**, right-click on Network and select Properties. Now select TCP/IP, and remove it. Remember to note down the configuration settings before you remove it, as you will need these settings again while re-installing. Now restart your machine, and reinstall TCP/IP.

The actual problem occurs when the Windows I/O operation fails due to
