

Power *up* your pQint

Throw in some animation and movies with the right noises and slide up the interest in your presentations!

Creating PowerPoint presentations is easy. However, presentations that drive the point home succinctly, need some finesse. If you like your presentations to be appealing and leave an impact on the boss and members of the committee, then you need animation or movies with some great audio in them that will make them sit up and take notice!

Animations

Slideshows with animated text, pictures and other content help you hold the interest of your audience, to emphasise important points and also make maximum usage of slide space by moving elements on the slide. However, do not over-use this element as it distracts from the main presentation.

You can have six types of animations in PowerPoint. The first is Transition. This is the effect that you see when a slide is revealed. The other five types of ani-

mations apply to the individual elements of the slide such as title, body, images, etc. Entrance is how an element enters the slide and Exit is how it exits.

The third type is Emphasis—when you highlight something to direct attention to it, while Fading is used to leave an element and move on to next.

The fifth type, Motion Path, is probably the most interesting animation to work with. It defines the path along which an element moves.

Here come 12 cool things you can do to enhance your presentation:

STEP 1 Schemes

The easiest way to animate slides is by using preset Animation Schemes—sequences of effects that can be applied to any slide, or the whole presentation. Press **[Ctrl] + [F1]** to activate the Task Pane. Here, go to **Slide Design > Animation Schemes**, choose a scheme and click 'Apply to all slides' to use the scheme for all the slides. Preset Animation Schemes cannot

animate individual elements. For that, you would require Custom Animation.

Find it on the Mindware CD : In the April 2004 Mindware CD, you will find all the files we have used throughout this article. Play around with that presentation, or just see the power of PowerPoint in action
