

STEP 2 Custom Animations

Custom Animation lets you animate individual elements on the slide. The Custom Animation task pane provides you with many such effects. Once added, you will see a number that indicates the playing order (marked with a '1' in the screenshot), star symbol that indicates the type of effect (marked with a '2' in the screenshot) and a mouse or a clock icon that lets you know when the effect

will start playing (marked with a '3'). Step 3 goes into the nitty-gritties of adding them to your presentation.

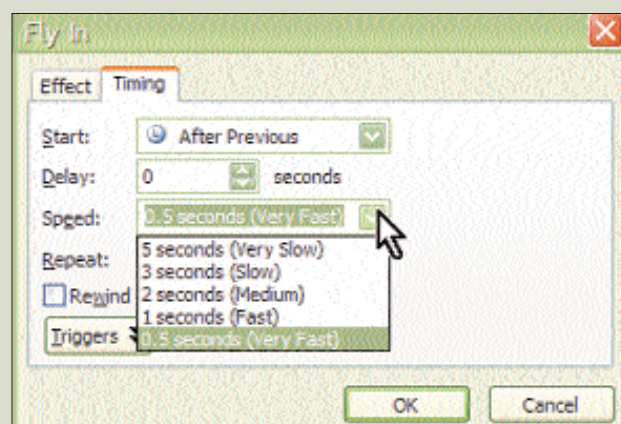

STEP 3 Adding Custom Animation

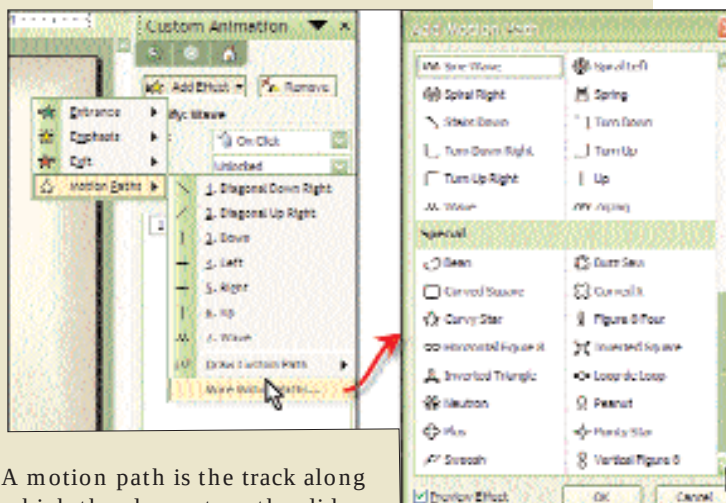

Select a Custom Animation and click on Add Effect to bring up a pop-up menu. Here, choose an effect and then point to an option in the second pop-up menu. Click on 'More Effects...' to see all the effects available under that type. A preview of the effect is shown immediately. The text on the Add Effect button changes to Change if you have already added some effect to an element. Step 4 shows you ways to fine tune these customisable options.

STEP 4 More Custom Options

Right-click on the effect to access the 'Effect Options...' menu. Here, you can change the settings for that button. You have three choices when it comes to setting the start time of the animation: 'On click' activates the animation only when the mouse button is pressed. Select 'With Previous' to start the animation with the previous animation. 'After Previous' causes the animation to commence once the previous animation is over. You can also choose the direction, speed and attach a sound to an effect as well. Jump to Step 5 to learn about another powerful way of adding animation—Motion Path.

STEP 5 Motion Path

A motion path is the track along which the element on the slide moves. To add the motion path to an object, select it and go to the Custom Animation task pane. Click the Add Effect button, go to Motion Path and click on 'More Motion Path' to choose a preset motion path. When you click on a motion path, the selected element on the slide shows you the preview of the animation, provided you enable the Preview Effect checkbox. You can also draw your own motion path. Simply, click on Add Effect and go to **Motion Paths > Draw Motion Paths...** To edit the motion paths, see the next step.
