

STEP 6 Fine Tuning the Path

A motion path has three components. A green arrow (marked '1' in the screenshot) denotes the starting point, a red arrow ('3') denotes the end point and the path is shown as a dotted line (marked as '2'). Right-click the path for a shortcut menu with three options: 'Reverse path direction' that interchanges the green and red arrows, 'Close path' that draws a straight line from the red arrow to the green arrow, and thus closes the path, and 'Edit Points'. Click 'Edit Points' to view the points. Drag these to edit the path. Usually, it's easiest to apply a preset path and edit it according to your requirements. With motion, you do need sound. Here's how you byte them in. Presenting Step 7!

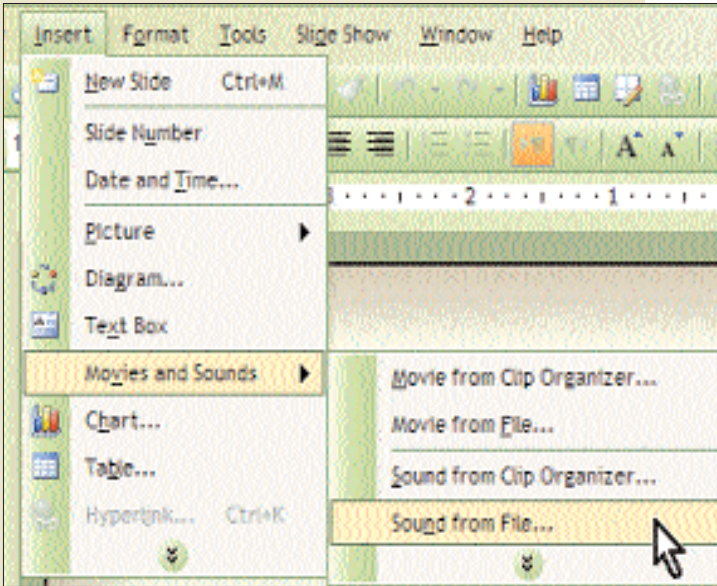

STEP 8 Set Sound Options

To set advanced sound options, go to the Custom Animation task pane, click the speaker icon, right-click the effect and choose 'Effect Options...'. Here, you will find options to set the Play and Stop, repeat, etc. You can also specify the number of slides for which the sound should play. You can access some of these settings by right-clicking the speaker icon and choosing 'Edit Sound Object'. If you insert a .wav file smaller than 100 KB, it's embedded in the .ppt file. Otherwise, they are just linked. Wanna play Audio CDs with presentations too? Go to the next step to learn how.

STEP 7 Playing Sound

Inserting sound in a slide is simple. Go to **Insert > Movies and Sound > Sound from a File** and select the desired sound file. This done, PowerPoint will ask you whether you want to play the sound automatically or when clicked. After this, a small speaker icon appears on the slide. Now to tinker with these sound notes...

STEP 9 CD Audio

Go to **Insert > Movies and Sound > Play Audio CD track...** and choose the Audio CDs. You can specify the start and end tracks and few other options here. You want movies in too? It's possible. Here's how. ➔
