

Symantec's Web site and activated it as well as updated the virus definitions. Now, what should I do?

Kabir

A This is a known issue and its solution was provided in one of the updates. To install the update, start Norton AntiVirus, run Live-Update, download all available updates, and then restart the computer when prompted.

If the error still persists in Windows XP, go to **Start > Run**, type '**msconfig**' and click OK. The System Configuration Utility appears. Here, click the Startup tab. Now look for the ccApp entry and ensure that it's checked. Next, click the Services tab and under the Service heading, locate Symantec Event Manager and Symantec Settings Manager and click the checkbox in front of these entries. Finally, click Apply and then OK. Restart the machine if prompted to do so.

For Windows 98/Me, go to **Start > Run**, type '**msconfig**' and click OK. Click the Startup tab, look for the entries for ccSetMgr, ccApp and ccEvtMgr and ensure that they are checked. Click Apply, and then click OK and restart the machine.

If the above process also fails to solve the problem, then download the Symevent installer file Sevinst.exe (http://ftp.symantec.com/public/english_us_cana da/symevent/sevinst.exe) onto your computer and execute the following command at the MS-DOS prompt:

C:\>sevinst.exe /r

Finally, restart the computer. Get in touch with Symantec support if the problem still persists.

The ASR wizard helps you create a rescue disk in Windows XP

Why am I cheated on the size?

Q. I have a Celeron 1.1GHz with 128 MB SDRAM, an 810BU Tomato Intel chipset motherboard and an 7,200-rpm 80 GB Seagate Barracuda hard drive. While creating a partition through Windows XP Professional, the drive capacity was shown as 80 GB. However, after the partition, it shows its space reduced to 74.5 GB. I am quite surprised at the loss of 5.5 GB.

Where did it go? What is the real problem? Is it possible to recover this lost space?

Tsering Ngodup

A The problem is not with your hard drive. By default, it will report the disk capacity to be approximately 74.5 GB for an 80 GB hard drive, just as it shows 18.64 GB for a 20 GB and 37.26 GB for a 40 GB drive.

There are a couple of reasons as to why the hard drive loses some space. The manufacturers themselves specify the size in decimal notation instead of the binary notation used by PCs. In binary notation, 1 KB stands for 1,024 bytes and not

1,000 bytes, as is the case in decimal notation. Hence, the computer perceives the size to be lesser than the specified value.

Another factor that brings down the size of the hard disk is the file system overhead. As a result of both these factors you get approximately 95 per cent of the size specified by the manufacturer, which is the same in your case. Thus, you can't do anything to recover this space.

98 after XP

Q. I have Windows XP Professional currently installed on my PC and I wish to install Windows 98 on it as well. How do I do that? My hard drive has two partitions.

Deepinder Singh Mann

A Ideally, you should be installing Windows 98 first, on one partition, and then Windows XP on the other partition. However, as you have already installed Windows XP, create a rescue disk for Windows XP by going to **Start > All Programs > Accessories > System Tools > Backup > Tools Menu > ASR Wizard**. Once the disk is ready, verify it by booting the computer with the floppy. Now, install Windows 98 on the other partition. You will not be able to boot to Windows XP once the installation is com-

plete. So, use the rescue disk to get back to Windows XP, open the boot.ini file residing in the C: drive using Notepad and add the following line under '[operating system]':

c:\="Windows 98"

Save and close the file, and that's it! You're done.

Data's encrypted

Q. I had some encrypted data on my system running Windows XP, and I'm not able to use that data now. Please help!

Praveen Tanwar

A If you have used the encryption built into Windows XP, then there is hope, provided that you have backed up the private key used to encrypt the file. Visit <http://support.microsoft.com/default.aspx?scid=kb;EN-US;223316> for information on the encryption process as well as steps to decrypt the file. However, if you do not have a backup of the key, then all we can do is give you our condolences for your data loss! When you lock something away and lose the key, you are just as locked out as any potential thief!
