

## This is how RFID could come into the supply chain for retail sales

## A Tags

The tags hold the inventory data, and are affixed to individual items and the shipping crates.

**B Readers**

The readers talk to the tags, obtain the information, and pass this on to the computer network

**Computer network**

The computer network gets the information from the readers, then updates their records.

The users can now track and analyse the status of individual items in the inventory.
